*To my son, Dr. Cyrus Farazmand (MD), May God bless him with a long, happy and successful life. And to my passed-away parents who taught me the high values of quality hard work, commitment, perseverance, and personal and professional principles of integrity, honesty, humanity, and leadership with kindness. May God bless their spirits.*

# Preface to the Second Edition

This is the second and more than double-sized edition of the Global Encyclopedia of Public – and nonprofit – Administration, Public Policy, Governance, and Management. Published with almost 1000 entries in 2018, the first edition was received with high recognition and praise worldwide, and with numerous enthusiastic suggestions and requests for the second expanding editions. Encouraged by contributing authors and section association editors, the number of authors with proposals interested in contributing to the new edition increased exponentially and worldwide. Those enthusiasms have continued to grow and to flow in with new entry proposals as this second edition goes into publication. This has been a truly remarkable experience and a highly rewarding task; it has involved several thousands of contributing scholars, practitioner-administrators and managers, and professional experts with specialization on various areas of public administration, governance, public policy, and nonprofit and nongovernmental organizations and their management from around the world.

The fundamental features of this second edition of the comprehensive global encyclopedia remain the same as identified and highlighted in the "Preface to the First Edition." This includes, first and foremost, producing and expanding **knowledge** as a powerful means to advancing civilizations, broadening scopes of human minds with appreciations for unlimited differences among peoples, cultures, societies, and geographical areas of the vast planet we as humans share with other creatures of the land, water, and air, as well as trees, plants, and vegetations humans and animals use for shelter, security, and sustainability. Knowledge changes and transforms societies and creatures from ignorance and narrow-minded tunnel visions; it contributes to enlightenments across the world. The *second* key feature words were, and are, the **Aims and Scopes** that are the broad and comprehensiveness of this Global Encyclopedia. While comprehensive and broad in scope, aims, and purpose, the focus was and still is primarily on the ***Public and Nonprofit*** sectors, and not the private business sector – at least not yet. The ***Purpose*** is to disseminate and expand the specialized knowledge in the above areas for more sound decisions and implementation to serve and promote public good, and for tempering and moderating the extremes in politics, military, and business organizations. Therefore, graduate and undergraduate students as well as instructors teaching courses and conducting research in public administration, public policy, governance, political science, sociology, and business

management will find a wealth of information and knowledge in this global encyclopedia.

Indeed, this Encyclopedia is not just for the people of specialized knowledge; it is for everyone, the general public and those interested in knowing how governments and public – and nonprofit – administration and policy processes work and should work. There are in the market a few large handbooks and small encyclopedias of public administration and public policy, but none, none-whatsoever comes even close to the magnitude of this huge or rather gigantic knowledge project in either scope or size as well as the sheer depth and number of contributing entries presented in this publication.

The *Third* key feature of this second edition is the **History and Development** – from its inception in 2015 – into such a huge global knowledge project. The Preface to the First Edition provides a detailed account of the history and development, and the **Process** of entry recruitment, selection, review, and publication in this global encyclopedia – see that text by flipping a few pages forward. That detailed information also provides great information about the purpose, scope, and other areas.

**Organization** The *Fourth* key feature is **Organization**, which is generally the same as described in the first edition preface: Entry titles are listed alphabetically, and for some specific nations or regions, titles are followed with a comma and name of the country. Generally, the entire Global Encyclopedia is organized into sections under specific associate editors for recruitment, reviews, and contributions. All major areas and sub-areas of public administration, public policy, governance, and management, and nonprofit organizations, are organized and covered under such sections and carried out by leaders serving as "associate editors." Yet, some crosscutting issues or areas like globalization or science and technology have been treated as separate areas.

**Size** The *fifth* key feature is **Size**. Size has two sub-features: (1) Size of the entries – short (2000–3000 words), medium (3000–5000 words), and long/or regular article length (5000–10,000 words) – that are the same as in the first edition of the encyclopedia. (2) Size of the volumes and pages or the number of the entries. While the first edition of the Encyclopedia contained just under 1000 entries and close to 7000 pages with a total of 8 volumes, the second edition of this huge project contains a total of 2029 entries, 13000+ pages, and 18 volumes. Thus, the second edition, inclusive of the first, has exceeded the initial vision, design, and goal of 2000 entries, a remarkable accomplishment, thanks to the contributing authors, section editors, and Springer's timely support and continuous production teams. And the number of entry proposals is growing with enormous enthusiasms and requests for the continuity of the project into a larger third edition. This strong global enthusiasm is expressed by numerous expressions of interests from contributing authors, new participants, and new section editors from around the world, all asking for a third edition for the next few years. I have described this remarkable nonstop growth by using an analogy of a high-speed train with a huge "golden cargo"; a high-speed golden train that cannot and should not be stopped till it reaches its final strategic destination with 5000 or more entries in the next five–six years. I am delighted, as the authors and associate section editors will be, to see Springer

publisher also interested and has agreed to my request with the proposal to continue with this high-speed golden train for a third edition, which will feature a number of innovative, novel ideas with unique entry materials.

**The Pandemic and Temporary Time-Lapse** As we all know, the entire world of nations and populations has been subjected to the harsh effects of the COVID-19 pandemic crisis. For over two years the governments, cultures, and people have struggled to battle this global public health crisis that has caused the loss of over a million human lives, destroyed hundreds of billions if not trillions of dollars in incomes and businesses, slowed down economic growth, and devastated many other economic and social capitals across the nations. The pandemic has also caused closures and postponement of millions of projects – individuals and groups or organizations – as the priorities shifted toward battling the global COVID-19 disease. The negative effects on the progress of the global encyclopedia were also noticed considerably, as many authors and section editors across the world had to attend to the Pandemic Crisis for their families and communities. The temporary lapse in the rapid progress, or rather slow down, is now mostly over as we see human resiliency overcoming the challenges caused by this global pandemic, and by remerging with vigor and enthusiasms for participation in the third edition from all over the world. We sincerely hope that no authors have been lost to this project due to the COVID-19, nor have experienced losses in the family, and we know that the new participants will certainly surge and make up with rapid increase in speed and number of entries for the time-lapse experienced during the past two years. In fact, the surge has already begun with vigor and motivation as new authors and associate editors are enthusiastically pouring in with proposals for publication of new entries. We strongly welcome these enthusiastic developments and will gladly bring them aboard the "golden train" toward the last strategic destination.

**Participants** It is undoubtedly clear that participants are the ones who have made this huge accomplishment of the second edition of the global encyclopedia. I cannot find enough strong words to express my appreciation and gratefulness to the participants for their immense contributions to making this knowledge project exceed expectations and achieve the initial strategic goal of the project. They are section editors, authors, and contributing administrative staff at Springer. More details are given on this below. However, it is important to make needed distinctions for recognition purposes the three groups who comprise the "section editors/co-editors, or associate editors carrying the tasks of section leadership" in this second edition. Of the three groups, the first are those many associate/section editors (with their co-editors) who recruited and reviewed a large number of entries for the first edition, but then had to move on with their career and life into other areas. These earlier participants were (and are) listed with their names under the first edition participants. We certainly acknowledge and appreciate their contributions to the Global Encyclopedia and wish them the best lucks in life. As editor-in-chief of the Global Encyclopedia, I took over and carried out the leadership tasks of these departing section editors.

The second group of section editors stayed on and continued with us in the journey on the golden train. They committed themselves to the project throughout with more entry contributions and leadership as associate editors. They are also determined to continue their participation toward the third edition of the project. I am most honored and delighted to see their uninterrupted services and contributions to the Global Encyclopedia project. They are also listed separately as Continuing Associate/Section editors in this edition.

The Third group of participants are the newcomers as new section editors with new areas of contributions bringing many new entries and authors whose participation has made the global encyclopedia a dynamically vibrant and unshakeable project. I am most grateful for their participation and contributions – they are also committed to the journey with us toward achieving the strategic goal of the project under the third edition in the next few years. We applaud their arrival and contributions.

Beyond this, it is the contributing participants who have made this project possible, from the start to the finish. Voluntary and unpaid commitments, dedication, delivery, quality, cooperation, collaboration, and teamwork are the words that describe the quality of people involved in the progress and accomplishment of this global knowledge project. They include the contributing authors of single and multiple entries, section/associate editors and their co-editors, and the publishing staff. Several thousands of contributing authors are involved in the first and second editions of the project. The authors and editors represent most if not all countries and regions of the entire world, making the project a truly global and certainly international in both scope of coverage and comprehensiveness of the topics, depth of content, and diversity. I am most honored to have the collaboration, cooperation, contributions, as well as support and collegial encouragement of these people from around the world. This, they all have been doing unpaid and purely for scholarly and collegial contribution purposes – amazingly rewarding! My deepest gratitude and appreciations to them all. As members of the editorial leadership team, the names and pictures of all section editors are listed in this publication, as they deserve the most recognition for their immense contributions to the accomplishment of the publication. Again, I am most humbled and honored.

Finally, I must acknowledge and express my deep appreciations to the Springer teams for this Global Encyclopedia: to (a) the architects of the project, Lorraine Klimowich, Michael Hermann, and Nicholas Philipson who's leadership support have been a powerful encouraging force of motivation for higher achievement; then (b) the project manager Alexa Hevron who has delivered an impeccable managerial service and support system, including during the last two years under the Pandemic; with (c) an equally dedicated and efficient staff team of several rotating experienced professionals from different parts of the world so they could offer support services nonstop, 24 h, 7 days a week, including weekends and holidays to all sections editors and authors, as well as myself. I would like to specifically thank Akshara PP and her predecessors (Sunali Mull), as well as the production staff under Kavipriya Venkataraman, all of whom tirelessly and nonstop have worked with me, the authors, and associate editors throughout these years under this second as well

as the first editions. My sincere and deep appreciations to all of them – I truly appreciate the publisher (Springer) for undertaking this global knowledge project and for having faith in me delivering it. I am most grateful and honored.

As editor-in-chief, my role has been one of a team building, coordinating, providing support systems, being available and responding to questions and offering clarifications, and simply one of a facilitating leadership throughout. I have also authored a few entries and recruited a fairly large number of entries in this edition, especially by taking over the sections under those departing associate editors after the first edition, but it is the contributing participants noted above are the ones who have made this publication possible. My deepest gratitude to all of them. It has been a time-consuming and highly demanding task for all involved, and I hope they also feel rewarded as they see the end-product out; it certainly has been fully rewarding for me. We all hope this publication will contribute to advancing knowledge in public administration, public policy, governance, and management, and help policy makers, administrators, and mangers in public/government and nonprofit and non-governmental organizations in an increasingly complex world.

# Preface to the First Edition

We live in a fast changing and highly complex world in which stability, predictability, order, prosperity, and harmonies are almost equally matched by disorder, conflict, contradictions, unpredictability, chaos, crises, poverty and despair, wars, and threats of catastrophic nuclear annihilation. The shadows of a constant threat of global nuclear annihilation seem to have consciously and unconsciously penetrated into and paralyzed the minds of billions of people, young as well as old, in developed as well as in developing countries of the world. The world has seen its horrors before, yet there still are those either ignorant or arrogant or both in positions of power with access to the buttons of destroying the entire planet (with its outer space) keep threatening the world with such annihilation. Indeed, we live in an age of madness. But, madness is not made by nature; it is the human actors who create and commit madness.

The tyranny of survival is as invasive and powerful as the hope and aspiration to overcome and defeat it in public and private life. This is a powerful dialectical challenge of modern time, our time and our children's future time, indeed the humanity's time. The only way to meet this dialectical challenge, and to overcome it, is to educate ourselves and our children, to expand the realms and scope of knowledge and spread the forces of enlightenment and hope worldwide deep into remote areas where it was impossible to reach until a few decades ago. Today, information and communication technologies are blessing tools that enable such possibility of reaching out to billions of current and future generations so they can learn the contrasts – the good, the bad, and the ugly – of what we human beings are capable of and have indeed done and can do it again. These tools help spread and disseminate knowledge, and knowledge is power, and power makes things happen or break things in place. Every human being with the power of knowledge has a moral and ethical as well as rational obligation to help in overcoming the evils of tyranny, exploitation, and repression, and to contribute to the enlightening dialectical forces of critical thinking, hope, empowerment, and humanity. In the realms of public administration, public policy, governance, and management, knowledge and information is paramount to rational and ethical functioning at the community, local, national, and global/international levels. Men and women of wisdom (both theoretical and practical) and expertise in modern organizations of governance, public administration, policy making and implementation, and management, and those outside with counterbalancing advice and prescriptions or influences, have a much more

serious obligation – compared to ordinary citizens; their professional obligation is to not only rationally but also ethically and normatively enhance the forces of enlightenment, reason, wisdom, humanity, and civilization, and against the forces of evil, tyranny, deception, and oppression.

Public administrators, managers, policy specialists, and advisers have the utmost important role in promoting common good, serving and promoting human empowerment, and serving not only the human civilizations but also the environment, the biosphere with all living creatures and plants that comprise our living planet earth with the space world that covers us from above. In a world full of predators of all kinds feeding to the energies of evil, tyranny, abuse, madness, mismanagement, corruption, and maladministration, advancing knowledge and expanding the horizons of possibilities, hopes, prosperity, and excellence in governance and management is not only a required necessity, but also a prescription for survival of all. While philosopher kings are scarce in number, the power of sound administrators, governors, managers, and policy specialists armed with the knowledge of rationality, ethical character, and principled professionalism can be and should be enhanced by education and training worldwide. Knowledge and skills in public administration, governance and government, management, and public policy areas are "specialized knowledge," professional knowledge with standards of excellence and responsibility.

Some of these professionals may occasionally turn into philosopher kings, but all of them have an ethical and professional role to temper down extremity and moderate the villainous tyrants, individuals with little or no regards for wisdom and rationality. Knowledge plays the pivotal role in maintaining and improving the integrity of the global systems, and producing and disseminating specialized knowledge is an even more important role in promoting the forces of rationality, character, wisdom, and fairness in this age of heightened complexities, contradictions, chaos, and madness.

The aim and purpose of this global encyclopedia is to produce firsthand specialized knowledge in the areas of public administration, public policy, governance, and management for the entire world. It is the world's largest of its kind, the most comprehensive, and an all-encompassing inclusive professional knowledge publication on the above tree fields with over 2000 entry essays or chapters of short, medium, and long sizes. The purpose is to disseminate and expand the specialized knowledge in the above areas for more sound decisions and implementation to serve public good, and for tempering and moderating the extremes in politics, military, and business organizations. Therefore, graduate and undergraduate students as well as instructors teaching courses and conducting research in public administration, public policy, governance, political science, sociology, and business management will find a wealth of information and knowledge in this global encyclopedia. Actually, the encyclopedia is not just for the people of specialized knowledge; it is for everyone, the general public and those interested in knowing how governments and public administration and policy processes work and should work. There are in the market a few large handbooks and small encyclopedias of public administration and public policy, but none, none-whatsoever, comes even close to the magnitude of this huge or rather gigantic knowledge project in either scope or

size as well as the sheer depth and number of contributing entry chapters presented in this publication.

The scope and features of the project is wide open and unlimited, with diversity in perspectives, depth, standard, and quality that characterize the content of this global knowledge project. While digested knowledge is a key word in this encyclopedia, analytical, empirical, descriptive, and theoretical approaches and methods used in the preparation of the entries are enlightening to readers. Diversity in content and standardized structural uniformity are key features of the publication. The first edition of this publication covers just about 1000 entries – short, medium, and long sizes – in 2018 in both print [in 6214 pages and 8 hard cover print bound volumes] and electronic version online. This publication serves as a vibrant, up-to-date, most valuably reliable source of global knowledge in the fields of public administration, public policy, governance, and management.

This global encyclopedia has a history starting in 2015. It has gone through stages with an enormous amount of efforts by everyone involved: the authors, section/associate editors, and the publishing staff who have been working nonstop, day and night, to help accomplish the objectives of this project. It is the product of a genuine teamwork of collaboration and communication on a large global scale. It is amazing and honoring to see how huge projects like this encyclopedia can and do get accomplished through teamwork, collaboration, and unpaid contributions of thousands of scholars and practitioners across the world. We all are delighted to see the first edition of this publication out. Organization: As expected, all entry titles are organized alphabetically, and in the case of some specific countries or regions, titles are followed with a comma and name of the country. For the purpose of organization and acquisition of contributing entries, the entire encyclopedia was designed with sections and section editors in mind; it was organized into the main areas and subareas of each of the three fields of public administration, public policy, and governance. All major areas and subareas of public administration were structured under, for example, comparative and development public and administration, public personnel/human resource management, public sector labor relations, organization theory and behavior, budgeting and financial management, accounting and financial management, social policy, economic policy, and so on. Certain countries and regions as well as some crosscutting issues like globalization or science and technology have been treated as separate areas to have a focus on. These areas and their subareas have been organized into sections with each section assigned to and carried out by section editors serving as associate editors in charge of specific sections, with some covering multiple sections like ethics and leadership. Each section covered a range of 50–200 entries, with entries that include a range of short (2000–3000 words), medium (3000–5000 words), and long (5000–10000 words) essays or chapters. While entries are digested knowledge with clear structural and expected quality contents, they all have had to follow structural standards. The overall average length of entries for all three categories is about 15 pages, double spaced, long. The process has involved stages starting with generation of over 2200 tentative topics, then identification and recruitment of associate editors who then recruited contributing authors, followed by endless email communications

with authors and the publishing staff at Springer, reviews and revisions of entry chapters, and eventual production and immediate publication of the entries online first. Participants: It is the contributing participants who have made this project possible, from the start to the finish. Voluntary and unpaid commitments, dedication, delivery, quality, cooperation, collaboration, and teamwork are the words that describe the quality of people involved in the progress and accomplishment of this global knowledge project. They include the contributing authors of single and multiple entries, section/associate editors and their co-editors, and the publishing staff. Over 2500 authors are involved in the project with over 1200 who have contributed to this First Edition. The authors and editors represent most if not all countries and regions of the entire world, making the project a truly global and certainly international in both scope of coverage and comprehensiveness of the topics, depth of content, and diversity. I am most honored to have the collaboration, cooperation, contributions, as well as support and collegial encouragement of these people from around the world. It is they who have made this publication possible. This, they all have been doing unpaid and purely for scholarly and collegial contribution purposes – amazingly rewarding! My deepest gratitude and appreciations to them all. As members of the editorial leadership team, the names and pictures of all section editors are listed in this publication, as they deserve the most recognition for their immense contributions to the accomplishment of the publication. Again, I am humbled and honored.

Additionally, I must acknowledge and express my deep appreciations to the Springer team for this project: to (a) the architects of the project, Lorraine Klimowich, Michel Hermann, and Nichols Philipson; then (b) the project manager Alexa Steele who has delivered an impeccably super service and support system; with (c) an equally dedicated and efficient staff team of several rotating experienced professionals from different parts of world so they could/can offer support services nonstop, 24 h, 7 days a week, including weekend and holidays to all section editors and authors, as well as myself. I would like to specifically thank Meghna Singh, Monika Garg, and their predecessors, as well as the production staff under Kavipriya Venkataraman, all of whom tirelessly and nonstop have worked with me, the authors, and associate editors. My sincere and deep appreciations to all of them – I truly appreciate the publisher (Springer) for undertaking this global knowledge project and for having faith in me delivering it. I am grateful and honored.

Finally, two doctoral students (now Ph.D. candidates) serving as my former and current Research Assistants for the last 3 years must be acknowledged and recognized: first, Arjola Balilaj, who assisted with the early stage of the project by generating many tentative topics; then Meena Subedi, who picked up where Arjola left. She has been working with me and the Springer staff like a solid team; I hope she will be able to continue as long as possible while working on her dissertation under my supervision and guidance as her committee chair. The names and photos of these student assistants as well as the Springer team members' names and pictures also appear in this publication.

As Editor-in-Chief, my role has been one of a team building, coordinating, providing support systems, being available and responding to questions and offering clarifications, and simply one of a facilitator throughout. Although

I have also authored a few entries and recruited a large number of entries, it is those participants noted above are the ones who have made this publication possible. My deepest gratitude to all of them. It has been a time consuming and highly demanding task for all involved, and I hope they also feel rewarded as they see the end product out; it certainly has been rewarding for me. We all hope this publication will contribute to advancing knowledge and expanding horizons in public administration, public policy, governance, and management, and help policy makers, administrators, and mangers in an increasingly complex world.

# About the Editor

**Ali Farazmand** is Professor of Public Administration at Florida Atlantic University. His areas of teaching and research are Intellectual Development (History, Theory, and Philosophy) of Public Administration, Organization Theory and Behavior, Organization Change and Public Management, Public Personnel and Labor Relations, Collective Bargaining/Negotiation, Administrative Ethics and Accountability, Globalization and Sound Governance, Modern Systems of Government, Bureaucratic Politics and Administrative Theory, and Executive Leadership.

Farazmand received his Ph.D. and MPA from the Maxwell School, an M.S. in Educational Administration from Syracuse University, and a B.S. in Business Administration from Tehran University. He is the author and editor of 24 books plus over 165 refereed journal articles and book chapters. He has published in *Public Administration Review*, *Administration & Society*, *Public Organization Review*, *International Review of Administrative Sciences*, *Public Administration Quarterly*, *International Journal of Public Administration*, *Public Budgeting and Finance, Public Finance and Management, Public Administration Quarterly, Korean Review of Public Administration*, and *International of Group Rights*. He is also the Founding Editor-In-Chief of *Public Organization Review: A Global Journal* (2001-Present) and served as the new Editor-in-Chief of *International Journal of Public Administration* (2011–2021). Farazmand is a leading, globally recognized international scholar, and a global consultant on public administration and governance reforms, administrative ethics, organizational change and public

management, organization design and performance, crisis and emergency management, public sector quality and productivity management, leadership, and globalization and global studies. His original groundbreaking contributions to knowledge are recognized in various areas of social science: bureaucratic politics and administrative theory, chaos and transformation theories, institutional theory, crisis and emergency management, surprise management theory, organizational elite theory, sound governance, and globalization.

# A

## Abortion as Social Policy

Adrieme S. Walker
Jackson State University, Jackson, MS, USA

### Synonyms

Aborticide; Feticide; Misbirth; Miscarriage; Termination

### Definition

Abortion is the termination of the process of gestation after the time when the zygote attaches itself to the uterine wall – normally 14 days after conception, but before the fetus is possibly capable of surviving on its own – normally 23–28 weeks from conception (Robinson 2015). A zygote is a fertilized ovum. An ovum is the mature sex cell generated by females in an ovary. Induced abortions are the intentional termination of a pregnancy before the fetus can live independently. An abortion may be elective, which is based on a woman's personal choice, or therapeutic. Therapeutic abortions are abortions performed to save the life of the pregnant woman, prevent harm to the pregnant woman's physical or mental health, terminate a pregnancy where indications are that the child will have a significant increased chance of premature morbidity or otherwise disabled, or reduce the number of fetuses to lessen health risks associated with multiple pregnancies (James and Roche 2016).

There are two types of common abortions – medical abortion and surgical abortion. A medical abortion is one that is brought about by taking medications that will end a pregnancy. The alternative is surgical abortion, which ends a pregnancy by emptying the uterus (or womb) with special instruments (Dudley and Mueller 2000). Dilation and curettage are the standard pregnancy practice performed for reasons such as examination of the uterine lining for probable malignant cells, examination of abnormal bleeding, and abortion. Curettage refers to cleaning the walls of the uterus with a curette. Mifepristone is an antiprogestogenic steroid, used in the medical termination of pregnancy. Methotrexate is an antimetabolite drug that works by separating fetal cells, consequently blocking the fetus from progressing any further.

An embryo is the stage of prenatal development which extends from 2 to 8 weeks after fertilization for human beings. A fetus is a Latin word meaning offspring, bringing forth, or the hatching of young. Fertilization is the process that starts when a sperm connects with an ovum. It ends with the combining of chromosomes from both the sperm and ovum to produce a full set of chromosomes, which are 46 in most humans. A trimester is a period lasting 3 months. A human pregnancy is often divided into three trimesters (9 months), between fertilization to birth. Viability is the ability for the developing

fetus to live on its own if it were delivered by cesarean section or by normal delivery, and given expert medical care. This typically occurs sometime after the 21st week of gestation or the 19th week following fertilization. By about the 23rd week gestational age or the 21st week following fertilization, on the order of 60% of fetus can survive outside the womb. The US Supreme Court defines viability as "potentially able to live outside the mother's womb, albeit with artificial aid." Pro-choice is a belief that women should be given access to abortions if she wishes to terminate a pregnancy. Pro-life is a belief that human life becomes a human person during the conception process when a unique DNA is produced. Thus the lives of all pre-embryos, embryos, and fetuses should be protected under law until birth.

## Introduction

Abortion has been used as a social policy since the late eighteenth century in the United States. Abortion is an issue that women all around the world have encountered. Since 2011, nearly half of pregnancies among American women were unintended, and about one in ten of these were terminated by abortion. Since the 1970s, there have been over 60 million unborn humans disposed through the policy of abortion. Women choose to have abortions for numerous reasons. Some feel they are too young for the duties of parenthood. Some are not in a stable relationship or worry about being a single parent. Financially, some cannot afford a child; some do not want their life's or career goals disturbed. Some pregnancies involve health reasons such as unhealthy fetus. The US Supreme Court struggles with the issue of abortion and, at present, is more concerned with the process of abortion than whether or not abortion is an appropriate social policy.

## History

The theoretical background of abortion requires members of the American political community to embrace the role of citizen-nachahmer, in the pursuit of truth about public action and the intimate consequences from those actions (Slack 2011). The core value of morality is an intimate social gospel, which citizen-nachahmer is charged with seeking through civic costly grace and through outward justice as holders of government positions. Dietrich Bonhoeffer rationalized that when the word of God and the "real" – the world created by God and given to us – are not in sync, it is the responsibility of the citizen-nachahmer and the government to modify the real so that it is in unity with the morality found in sacred document (Slack 2011). The Roman Catholics and other evangelical Christians form a major section within the pro-life society, which could also be viewed as citizen-nachahmer. These groups generally disagree with abortions and approve of executions related to convicted murderers. Pro-life supporters would allow abortions under the following circumstances:

- Some would allow abortions only if needed to save the woman's life.
- Some would allow abortions to women who have become pregnant through rape or incest.
- Some would allow abortions for women who would suffer serious or permanent disability if the pregnancy were allowed to continue.

### Social and Medical Acceptance of Abortion in the United States

In 1795, Marquis de Sade published his *La Philosophie dans le boudoir*, in which he proposed the use of induced abortion for social reasons and as a means of population control and in the social acceptance of abortion in the United States. Prior to Marquis de Sade, induced abortion had not been discussed in public; de Sade's writings about induced abortion received the vocal point which begin to spread in Western society. For medical justifications, abortion was also viewed as an acceptable alternative to the cesarean section procedure. The first such modern reference was by William Cooper, a Doctor of Medicine in London who in 1769 suggested the possibility of inducing abortion as an alternative to the cesarean operation, in order to resolve undeliverable pregnancies in cases of

pelvic disproportion (Farr 1980). This medial justification was accepted by many obstetricians in Europe, and during the latter half of the nineteenth century, "the indications, especially in Germany, were extended to include tuberculosis, heart disease, nephritis, and certain forms of psychosis" (Page 1972). By 1880, all states had regulated abortion, but many states continued to permit abortions when there was a threat to the life of the mother or a serious threat to her health as determined by a physician (Mohr 1978).

### Abortion and the American Medical Association

The American Medical Association (AMA) was formed in 1847; this association quickly made the criminalization of abortion one of its highest priorities, a move based not on moral objections to abortion but rather because the issue served so well as the center of the new organization's professionalizing project (Starr 1982). The objective of the AMA society was not to forbid all abortions; the AMA suggested that physicians should regulate the terms under which any abortions took place. The AMA would change its opinion from the nineteenth century to the post-World War II era. In 1970, the AMA voted in favor of legal abortion, thereby reversing its campaign of some 100 years earlier to criminalize the procedure (Joffe et al. 2004). The AMA resolution that was passed by its House of Delegates contained the statement that doctors should not provide abortions "in mere acquiescence to the patient's demand" (Halfmann 2003).

### Abortion as a Tool for Population Control

During the nineteenth-century struggles of a fast-growing population, abortion was encouraged as a form of limiting the "consequences" of immigration. During the beginning of the late nineteenth century, immigrants were mainly from Eastern and Southern Europe and Russia, many of the Jewish faith. After World War I, the mood in America continued to favor restricting immigration. Abortion found effectiveness in the nineteenth century as the country became more industrial, and hence, larger families (needed on the farm) were not needed in factory life – in fact larger families became a liability of cost in the emerging urban life.

The Comstock Law of 1873 declared birth control and abortion information obscene and banned it from the US mail. Many states passed laws against contraception because there was a fear that immigrant groups tended to have larger numbers of children than white Americans born in the United States. White Americans feared that immigrants had come to dominate society if white, Protestant women did not have more babies. In 1920, Margaret Sanger, advocate of planned parenting (now known as Planned Parenthood) and founder of the American Birth Control League, wrote "Racial Quotas in Immigration" for her Birth Control Review, advocating controlled immigration of slaves, Hebrews, and Latinos because of their "lesser intelligence abilities." Sanger's Planned Parenthood guided the battle to have the Comstock Law reversed. In 1932, Sanger's article, "A Plan for Peace," in Birth Control Review suggested a Congressional Department to keep the doors of immigration closed to certain aliens, such as the feeble minded, epileptic, prostitutes, and criminals. The Comstock Law was declared unconstitutional in 1938, although state laws against birth control remained.

## Types of Abortion

### Medical Abortions

Medical abortions became available in the United States in the early 1970s. The procedure is noninvasive and involves no surgical instruments. During this procedure, anesthesia is not involved, and with this particular abortion, drugs are given orally or via injection. Medical abortions demand multiple visits to the doctor. With the medical abortions, women may see the insides of the womb as it is forced out, and it is common that the bleeding occurs more after medical abortions than after a surgical abortion.

In 2003, methotrexate and mifepristone were the drugs that became available in the United States in order to induce abortion. Methotrexate works by separating fetal cells, consequently

blocking the fetus from progressing any further. Methotrexate is used in union with misoprostol, which is a prostaglandin (fatty acid) that arouses contractions of the uterus. Methotrexate may be taken within 49 h after the first day of the last menstrual cycle. An injection of methotrexate is injected on the first visit to the doctor. On the second visit, which is normally within a span of 1 week from the first visit, the woman is vaginally given misoprostol to stimulate the contractions of the uterus. Within 2 weeks after the second visit, the woman will flush out the insides of the uterus; this in turn ends the pregnancy. To ensure that the abortion is effectively complete, a follow-up visit is highly recommended. Mifepristone works by hindering the achievement of progesterone, which is a hormone necessary for pregnancy to carry on. In 2000, mifepristone was approved by the Food and Drug Administration (FDA) as an alternative to surgical abortion. Mifepristone may be taken within 49 h after the first day of the last menstrual cycle; the woman is given a single mifepristone pill. After 2 days of taking the mifepristone pill, the woman returns to the doctor to determine if the pregnancy has been aborted; if the pregnancy has not been aborted, the doctor then gives the woman two misoprostol pills, which in turn will cause the uterus to contract. During the third visit, the doctor will observe via ultrasound that the abortion is carried out fully. If the pregnancy has not been aborted by the third visit, a surgical abortion is then carried out; surgical abortions are utilized due to the fact that the fetus may be impaired.

### Surgical Abortions

Surgical abortions are one of the most common utilized abortions. During the first 12 weeks, suction aspiration or vacuum abortion is the most common method. This particular type of abortion is known as the manual vacuum aspiration (MVA) abortion, and it involves the removal of the fetus or embryo, placenta, and membranes by suction using a manual pump. The electric vacuum aspiration (EVA) method uses an electric pump. Manual vacuum aspiration is known as "mini-suction" and menstrual withdrawal. The manual vacuum aspiration can be used in early pregnancy and does not involve cervical dilation.

Dilation and curettage (D&C) is the second most used method of surgical abortion. Dilation and curettage is the standard pregnancy practice performed for reasons such as examination of the uterine lining for probable malignant cells, examination of abnormal bleeding, and abortion. Curettage refers to cleaning the walls of the uterus with a curette. Dilation and curettage involves gentle stretching of the cervix with a series of dilators or specific medications The inside of the uterus is at that time removed with a tube attached to a suction machine, and the walls of the uterus are cleaned using a slender loop called a curette. During the 15th week of gestation up until the 26th week, there are other techniques that are required to be used. Dilation and evacuation (D&E) consists of opening the cervix of the uterus and evacuating it using surgical utensils and suction.

Some of the advantages of the surgical abortion are that it is usually done as a 1 day outpatient procedure; the procedure takes roughly around 10–15 min, bleeding after the abortion lasts for duration of 5 days or less, and the woman does not visually witness the products of her womb being removed. The disadvantages are that this practice is invasive, and infections may occur.

## Abortion and the Law

Abortion has been a legal procedure in the United States since 1973. In 1973, *Roe* vs. *Wade*, 410 US 113 overturned abortion laws in the United States by making it legal for all women to receive an abortion during the first trimester of pregnancy. The *Roe* vs. *Wade* court cases have advanced toward a more legal right to decide who gets the privilege of deciding when abortions are deemed legal. Legally, with the *Roe* vs. *Wade*, 410 US 113 rulings, within the third trimester of a woman's pregnancy, the unborn child reaches a point of viability which grants it the right not to be aborted. There are certain exemptions to this ruling, such as heinous events such as rape, incest, or if the birth shall bring harm to the well-being of the mother. The legalization in 1973 advanced

abortion to the forefront of both the political and legal debates where it remains in today's societal debates, with advocates and challengers mixed up in encounters over what type of problem it is and what can and should be done about it. Politically and legally, *Roe* vs. *Wade*, 410 US 113 is the not the only Supreme Court ruling related to abortion. Other cases that followed the *Roe* vs. *Wade*, 410 US 113 case were the *Akron* vs. *Akron Center for Reproductive Health*, 462 US 416, 431–39 (1983), *Webster v. Reproduction Health Services*, 492 US 490, 507–11 (1989), and *Planned Parenthood* vs. *Casey*, 505 US 833, 846–53 (1992).

The *Planned Parenthood* vs. *Casey*, 505 US 833, 846–53 Supreme Court ruling placed more restrictions and limitations on abortion. *Planned Parenthood* vs. *Casey*, 505 US 833, 846–53 ruling sanctioned that there be a 24 h waiting period and a minor needing to have parental consent, and the abortion provider has to be responsible and required to retain records as being legitimate. The *Planned Parenthood* vs. *Casey*, 505 US 833, 846–53 ruling also provided the fairness and equivalence of both men and women by declaring a spousal consent clause unconstitutional under the 14th amendment; this means the husbands should not have an unconstitutional rejection over a female's decision to have an abortion.

The Supreme Court sets standards concerning significant social policy issues, and their former rulings act as a key character in determining the correct and fair-minded choice on the issue. The verdicts of the Supreme Court rest very profoundly on the judges who hold positions as Supreme Court justices. A more liberal-minded Supreme Court would passionately sponsor the woman's right to decide what she does with her own body. On the other hand, a Supreme Court that consists of more conservative judges would be more persuaded to compete with making pronouncements that would intensify the precedent established in *Roe* vs. *Wade*, 410 US 113.

In 1992, the Supreme Court in *Planned Parenthood of Southeastern Pennsylvania* vs. *Casey*, 505 US 833 overruled Roe's strict trimester pregnancy policy of state abortion regulation and replaced it with the "undue burden" standard. The obscurity of the undue burden standard permitted several states to endorse an assortment of restrictive abortion laws. Restrictive state abortion regulations may persuade the possibility of women aborting an undesirable pregnancy in two ways. First, these restrictive abortion laws may cost financial costs such as out-of-pocket cost of the abortion, expenses on travel and accommodations, lost work time, and/or childcare expenses to increase. Additionally, the emotional burdens such as guilt, remorse, regret, humiliation, and psychological trauma experienced by women getting an abortion may arise. Second, restrictive abortion laws may lessen the access of abortion amenities by condensing the quantity of abortion providers resulting in an increase in women's search locating an abortion provider and time costs associated with obtaining an abortion. The more restrictive the abortion law, the costlier the abortion. If abortions become too overpriced, women may have less of them. The method in which restrictive state abortion laws modify women's pregnancy resolution decision-making calculus can be fairly answered.

In 2003, Congress and President Bush approved the Partial-Birth Abortion Ban Act of 2003 (Public Law 108–105, 117 Stat. 1201, 18 U.S.C. § 1531, PBA Ban), which rules out the dilation and extraction (D&X). The D&X procedure can be performed both after late-term miscarriages and in late-term abortions. In 2004, another legal decision that modified the lawfulness of abortion is the Unborn Victims of Violence Act of 2004 (Public Law 108–212). The Unborn Victims of Violence Act of 2004 (Public Law 108–212) proposed that any violent crime against a pregnant woman counts as two separate crimes: one against the woman herself and the other against the unborn child. This, in turn, has heightened the debated discussions regarding abortion for the reason that it appears as an oxymoron to permit the fetus to be measured as a person in illegitimate proceedings, nevertheless, still allowing abortion to be regarded to as permissible. This further adds to abortion being viewed as a social policy due to the fact that it is conflicting to provide a fetus rights as a human while still

granting a woman the legal right to decide on abortion as an option.

## Conclusion

Abortion is viewed as a social problem in the United States. Some abortions are turned to as the outcome of societal pressures such as the disapproval of single motherhood, people with disabilities, scarce monetary funding for families, or lack of access to or rejection of contraceptive methods. For almost two centuries, women's reproductive procedures, including abortion, have drawn the awareness of a wide range of social players such as medical professionals, politicians, religious groups, legal professionals, scientists, women's rights organizations, and several other groups and individuals taking a keen interest in the issue. Abortion has continuously held a significant place in the sociopolitical debates, uneasily placed in the crossing of medicine, women's rights, and morality. The right to life, the right to liberty, the right to security of person, and the right to reproductive health are all major issues of human rights that are sometimes used as explanation for the presence or absence of laws influencing abortion.

In places where abortion is legal, detailed conditions have to be met before a woman may obtain a safe, legal abortion. In the United States, these prerequisites usually are determined by the age of the fetus, often using a trimester-based system to regulate the view of legality, or as in the or on a doctor's appraisal of the fetus' viability. Also, some authorities require a waiting period before the abortion procedure, prescribe the distribution of information on fetal development, or require that parents be contacted if their minor daughter requests an abortion. One of the most problematic things to debate when it comes to abortion is how to make a broad policy that satisfies the needs of majority of individuals in a given society minus concentrating exclusively on the extreme conservative outlook, the extreme liberal outlook, or the numerous moderate outlooks on the issues of abortion. Policymakers must remember that a decent policy does not rest on life-threatening views but tries to cover as many points of views while being conscious of the fact that one is not able to please every person in society.

# Absenteeism in Organizations

Ann-Kristina Løkke
Department of Management, Aarhus University, Aarhus C, Denmark

## Synonyms

Nonappearance; Shirking; Work attendance

## Definition

Absenteeism is the failure to report for work as scheduled.

## Introduction: The Problems and Consequences of Absenteeism

Absenteeism is a problem in many organizations. It has a number of negative consequences for society at large, organizations, colleagues, and employees.

Apart from the economic consequences such as sickness allowances, healthcare treatment, pay for temps or overtime pay, lost productivity, etc., there are also a number of personal costs. For the involved person, sickness absence may have major consequences such as a poorer life quality, loss of identity if away from work for long periods of time, lack of social contact to colleagues, worries about own health, loss of professional competences, and perhaps even discharge. There are also consequences for the colleagues of the absentee, such as increased workload when substituting the absent colleague.

The many negative consequences mean that absenteeism is on the agenda in many HR departments. Hence, the hunt for a final solution to eliminate absenteeism has started in many organizations. Also in academia, research in finding explanations for absenteeism has an ever increasing attention.

In many organizations, absenteeism has been allowed to grow as it has been tabooed as belonging to privacy. Today absenteeism is considered a natural and integrated focus area in many organizations. This is a positive development as absenteeism should be considered a strategic issue for any management.

Absenteeism is higher within the public sector than in the private sector. There can be many reasons for the relatively high absenteeism in the public sector such as greater social responsibility, less focus on the bottom line, other types of jobs, and other types of professionals. However, there is a great variety in absenteeism across comparable organizations within the same sector with similar profiles for jobs and employees. This may indicate that absenteeism is not just a matter of health, but also a result of local initiatives to reduce absenteeism, management procedures, and absence cultures. Hence, individual workplace policies and practices either increase or decrease the motivation to come to work.

## The Concept of Absence

The traditional definition of absence is the "failure to be present at the appropriate time and in the appropriate place to meet the terms of the contract" (Gibson 1966). The contract can be more or less formal.

Later in literature the above definition is developed into "an individual's lack of physical presence at a given location and time when there is a social expectation for him or her to be there" (Martocchio and Harrison 1993).

For both definitions it applies that absenteeism is identified based on a concrete, measurable behavior – in other words, whether or not the person is (physically) present or not. But today an increasing number of employees work from home or in virtual offices, and thus the physical presence is not always decisive. Today, an employee is thus considered absent if the organization expects him – stated in a formal or informal contract –to handle a number of tasks and/or functions which are then not handled, regardless of the physical position of the employee. Therefore a more contemporary and relevant definition would be: "Absenteeism is the failure to report for work as scheduled" (Johns 2008).

The described definitions do not distinguish between the different varieties of presence or absenteeism. Employees may hold four roles, they can be present at the workplace when (1) healthy and (2) ill and absent when (3) ill and (4) healthy.

Managers have to pay special attention to employees who are ill but at work, employees who are healthy but not at work, and employees who are ill and not at work where the reason for the illness is caused by work-related issues.

When employees are ill but still go to work, the so-called presenteeism, it has a number of consequences. Apart from the discomfort of the

employees and the risk of being ill for a longer period of time, the employees are less effective. There is also a higher risk of failures and accidents and of infecting colleagues.

The reasons for employees to come to work despite being ill may be fear of losing their jobs, to miss out on promotion, or losing earned income. It may also be out of consideration for customers or clients or colleagues so that they are not given more tasks or are called to work when supposed to be off duty. It may also simply be to avoid that own tasks are piling up on the desk. Finally, it might also be due to the company's absence culture including the manager's reaction to and handling of the absence.

## Voluntary and Involuntary Absence

Normally there are two types of absence – absence that cannot be avoided and absence that involves a certain degree of voluntariness or choice. In literature the two types of absence have different designations such as voluntary/type B absence/black/not certified contrary to involuntary/type A absence/white/certified (e.g., Chadwick-Jones et al. 1973; Geurts 1994; Steers and Rhodes 1978; Thomson et al. 2000).

The standard for unavoidable, involuntary absence is subject to interpretation and can be set by the individual or by consensus in the work groups or departments (Chadwick-Jones et al. 1973).

Absenteeism is thus a result of the environment and surroundings of an individual person as well as an actual choice. A person's decision either to be absent or present may thus be influenced by contrary issues. Some persons are therefore absent even if healthy from a medical point of view, whereas others go to work despite being ill.

The involuntary absence is certified illness or other legitimate periods of absence such as funeral attendance, illness in the family, and transportation problems due to weather. This kind of absence is outside the immediate control of the person.

The voluntary absence is not related to illness and is under the immediate control of the person. Voluntary absence is based on an individual choice or the individual's norm. This kind of absence is avoidable and can be affected by various motivational factors.

In practice, it is of course difficult to distinguish between the two kinds of absence. In Denmark there are no estimates for the proportions of the two kinds of absence. In Holland it has been estimated that up to 85% of all illness periods are based on an actual choice or a decision taken by the individual rather than on the advice of a doctor (Geurts 1994). Part of this absence is naturally actual, short-term illness, such as the flu, where the doctor is not ordinarily consulted.

It is important to distinguish between voluntary and involuntary absence when it comes to how absence is measured and used in analyses forming the basis for absence initiatives in organizations. Since exclusively voluntary absence is influenced by various motivational factors, this kind of absence should be in focus. The voluntary absence is often shorter periods of time, whereas the involuntary absence is related to illness and often results in longer periods of absence (Chadwick-Jones et al. 1982). In statistical analyses, the number of absence periods is recommended as a measure for the voluntary absence rather than the duration as a count of days. It might also be recommendable to omit absence periods of certain durations in order to avoid absence which most probably may be labeled as involuntary, in the analyses.

In order to identify a pattern, it is still a good idea to register all kinds of absence including a number of days and periods and also the weekdays for the absence. But for cause-effect analyses, where the intention is to explain the voluntary absence by means of a number of factors such as well-being, strain, age, gender, etc., absence periods are recommended.

## Short- and Long-Term Absence

It is important to distinguish between short- and long-term absence since the reasons for the two kinds of absence may differ. Long-term absence is often a better indicator for the employee's health,

whereas the short-term and frequent absence is more often related to the job satisfaction in the broad sense – that is, the voluntary absence as mentioned above.

All short-term absence is however not related to an actual choice to be absent (for instance, funeral attendance), and at the same time, the long-term absence may also be related to the job situation; it may be caused by strain. It is therefore always important to focus on the reasons for both short- and long-term absence in order to find out if something can be changed in the work environment.

It is particularly important to follow up on short-term absence, if there is a pattern in the absence since this may indicate that the reasons for the absence are to be found in the work environment. Some employees are frequently absent on special weekdays, Mondays or Fridays or after holidays. Others have increased absence after certain tasks and others again are generally absent more frequently.

It is always important to follow up on long-term absence. The reason for this is that there is a risk that the connection to the workplace becomes more unstable or even disappears. It is thus important to contact the ill employee so as to secure that he/she quickly gets back, possibly on changed conditions.

## The Determinants of Absence

Absence is a multidisciplinary research area. Thus, it has been viewed as a form of worker deviance (sociology), a result of labor-leisure trade-off (economics), a reaction to illness (medicine), a violation of the contract (law), and many more (Johns 2008). As a consequence of the multi-disciplinarity in the research, the explanatory determinants of absence are related to many different areas, such as personal characteristics of the employee and the manager, factors related to the job situation, the manager behavior, and the absence cultures.

Most previous research on absence takes its spring in an individual approach. This approach relies on the assumption that motivation to be absent from work is determined by either personal characteristics or individual responses to the job situation.

One of the most acknowledged contributions to absence literature is "A Process Model of Employee Attendance" (Steers and Rhodes 1978). This model describes how personal characteristics, e.g., gender and age, directly influence the ability to attend work and indirectly influence attendance motivation, the latter having the primary impact on attendance.

Personal characteristics influence the individual's values and expectations as regards his/her job, and these again influence job satisfaction. Job satisfaction directly influences attendance motivation. Pressure to attend, such as work group norms and work ethics, directly influences attendance motivation. Attendance motivation is furthermore a result of the individual's evaluation of the job situation. Thus, the job situation, such as the management style and co-worker relations, influences job satisfaction, and job satisfaction influences attendance motivation. The model is named "process" because of its cyclical nature, where attendance behavior has a reverse effect on the job situation, pressures to attend, and finally attendance motivation.

## Personal Characteristics

The employees' personal characteristics such as gender and age have proven to be of major importance for absenteeism but also their managers' personal characteristics influence the absenteeism – directly as well as in interaction with the employees' personal characteristics.

Research shows that managers' personal characteristics interact with their employees' personal characteristics in the way that the bigger the differences between manager and employees as to personal characteristics, the less attracted are the employees to the organization (Perry et al. 1999). The assumption behind this is that individuals who are alike as to demography also share values and opinions. Individuals who are alike within the organization are more inclined to have the same attitude to absenteeism, and they will to a great

extent develop the same absence behavior (Rentsch and Steel 2003). The interaction between the managers' gender and those of the employees has been confirmed empirically (Løkke 2008).

## Management's Importance for the Absence Culture

An absence culture is a key construct defined as "the set of shared understandings about absence legitimacy in a given organization and the established "custom and practice" of employee absence behaviour and its control (e.g., predominant supervisory styles and worker beliefs about co-workers' attendance behaviour)" (Johns and Nicholson 1982, p. 136). Furthermore, Chadwick-Jones et al. (1982, p. 7) state that "The nature of this culture is known by employees, though partially and imperfectly, but to that extent absences are regulated by the norm. Thus, the norm is what they collectively recognize (usually with management collusion) as suitable and appropriate for people in their job, their unit, their organization, given the particular conditions, both physical and social, of tasks, pay, status, and discipline."

The definitions above shed light on managers' role in reducing employee absence.

The manager influences the culture in three ways. First and foremost the absence culture is influenced by the manager's own absence behavior because the manager is the role model for the employees. The employees observe the absence behavior of their manager and thus learn what is legitimate, and then they adjust their own behavior according to this norm. Investigations in the private as well as in the public sectors show a clear cohesion between managers having a substantial absenteeism and their employees having a substantial absenteeism (Kristensen et al. 2006; Løkke 2008). To some extent, managers can thus control the absenteeism among their employees by being a good example.

The way in which the manager talks about the absence norm and the consequences of absenteeism for the organization also influences the absence culture. Add to this the disciplinary consequences of the absence which the manager uses, such as summons for sickness status meetings, written warnings, less bonus, fewer challenging working tasks, and fewer development opportunities.

Finally, the absence culture is influenced by the general leadership style of the manager. Results show a link between long-term absence for females and poor management quality measured by the extent to which the immediate superior ensures that the individual staff member has good development opportunities, gives high priority to job satisfaction, is a good work planner, and is good at solving conflicts (Lund et al. 2005). Furthermore, it seems that absence decreases if managers perform a transformational leadership style (Westerlund et al. 2010; Zhu et al. 2005). A transformational management style is characterized by the four i's – inspiring motivation, individualized considerations, intellectual stimulation, and idealized influence (Avolio et al. 1991); thus there are individual considerations for the needs and working skills of the employee. The transformational manager also acts as role model and is a good example and continuously expresses the values on which his management style is based.

## Conclusion: From Sick to Healthy Absenteeism

All organizations should work for a natural and healthy level of absenteeism for employees and managers. The aim is not to eliminate all absence because this would mean that employees at times are coming to work although they are ill, because flus, fevers, and the like will always exist. This so-called presenteeism is unhealthy for the organizations because it results in less efficiency, more accidents, a risk of infecting colleagues, and a risk of being absent for a longer period. Reasons and consequences of presenteeism are a growing research area.

Apart from taking into consideration a certain level of healthy absenteeism, the organizations should not have any excuses for not dealing with

the sick absenteeism, understood as the absence that is caused by working conditions and which can be influenced by various initiatives.

Research shows that the reasons for absenteeism are to be found in the working environment, including the management, the job characteristics, and the prevailing absence cultures. Also a number of financial determinants are important such as wages, number of working hours, sick leave allowances, the financial fluctuations in society, etc. Finally, the personal characteristics, dispositions, and of course the health play an important role.

# Abusive Leadership

Lindie H. Liang and Douglas J. Brown
Department of Psychology, University of Waterloo, Waterloo, ON, Canada

## Synonyms

Abusive supervision; Abusive supervisory behaviors; Destructive leadership; Supervisor undermining; Supervisory abuse; Tyrannical leadership

## Introduction: What Is Abusive Leadership?

There exists a litany of disparate constructs for describing abusive leadership, such as abusive supervision, petty tyranny, supervisor aggression,

supervisor incivility, supervisor undermining, workplace bullying, and negative mentoring experience. Although these terminologies differ in describing abusive leadership, they all overlap to some degree. One dominant construct in the literature that has a unifying theoretical framework is abusive supervision, which is defined as subordinates' perceptions of the extent to which their supervisors engage in the prolonged display of nonphysical hostile verbal and nonverbal behaviors—such as public ridiculing and belittling, taking credit for subordinates' work, giving subordinates the silent treatment, and invading subordinates' privacy (Tepper 2000).

The construct definition of abusive supervision is characterized by three key features. First, abusive supervision is subordinates' perceptions of their supervisors' behaviors. As such, whether their supervisors' behaviors are actually abusive or not is based on the subordinates' subjective assessment. Second, abusive supervision is a continued and sustained act of nonphysical hostility. Thus, the supervisors' hostile behaviors are not considered abusive if they occur infrequently. Finally, supervisors engage in abusive supervision to achieve certain goals. Although it is often assumed that supervisors engage in such behaviors to harm their subordinates, supervisors who engage in abusive supervision may not necessarily have the intent to cause harm; rather, they may engage in abusive supervision to elicit high subordinate performance, to send a clear message to subordinates, or to deter other subordinates from engaging in certain behaviors in the future (Tepper 2007).

## Consequences of Abusive Supervision

Although it occurs infrequently, abusive supervision incurs significant costs for all parties involved. From an organizational perspective, supervisory abuse is financially costly in terms of its effects on employee productivity and job performance, absenteeism, turnover intentions, job attitudes, and employee retaliation. For the immediate target, supervisory abuse negatively affects their physical and psychological well-being, as well as the well-being of their family members and coworkers. Given the far-reaching impact of abusive supervision, it is not surprising that a plethora of studies have been conducted to better understand why and under what conditions the negative consequences of abusive supervision can be exacerbated or overcome. The section below summarizes the consequences of abusive supervision as well as the key explanatory mechanisms and boundary conditions.

### Subordinate Retaliation and Aggression

There is a robust relationship between abusive supervision and subsequent subordinate retaliation or subordinate aggression. Abused subordinates frequently directly retaliate by engaging in aggression directed at their supervisors, such as acting rudely toward their supervisors, publicly embarrassing their supervisors, and refusing to talk to their supervisors. They also engage in aggression directed at the organization, such as putting little effort into work, taking property from work without permission, and coming in late to work without permission. In addition, abused subordinates engage in aggression directed at their coworkers, such as making fun of their coworkers, acting rudely toward their coworkers, and publicly embarrassing their coworkers. Meta-analytic results have shown that the relationship between abusive supervision and subordinate aggression directed at the supervisor is the most robust, followed by aggression directed at the organization, and aggression directed at coworkers.

There are several mechanisms that can explain why abused subordinates engage in aggression directed at their supervisors, organization, and coworkers. One such mechanism is the social exchange explanation. Social exchange theory is one of the most influential theories of workplace relationships and behaviors (Cropanzano and Mitchell 2005). A basic tenet of social exchange theory is that the relationships between supervisors and subordinates evolve over time into a mutually trusting relationships, and people within these relationships have the implicit expectation that when a party does another party a favor this favor will be returned in kind in the future. As such, a social exchange relationship is dependent

on the mutual trust of both parties. In the workplace, employees may develop a reciprocal and mutually trusting relationship with their organization and may have the expectation that their loyalty and hard work will be rewarded by their organization. However, abusive supervision entails behaviors such as constantly criticizing subordinates' work and not giving subordinates the credit that they deserve, and such treatment may violate employees' expectations that their organization values and cares about them; as a result, employees may come to believe that their commitment to the organization will never be recognized and rewarded. Hence, abusive supervision could lower subordinates' perceptions of the quality of their exchange relationship with their organization, which in turn results in subordinate retaliation directed at their supervisor, at their organization, or at their coworkers.

Another theory that explains the abuse-aggression relationship is self-determination theory (Ryan and Deci 2000). Self-determination theory advocates that humans possess three fundamental psychological needs: the needs for autonomy, competence, and relatedness. The need for autonomy refers to the drive to initiate actions that are consistent with one's integrated sense of self without any external influence. The need for competence refers to the desire for mastery of the environment and the desire to successfully engage in challenging tasks to attain desired outcomes. Finally, the need for relatedness refers to the need to experience a sense of belongingness and mutual respect that enables one to feel valued as an individual and/or member of a group. Within the context of abusive supervision, research has shown that sustained supervisory mistreatment threatens subordinates' overall basic need satisfaction. In particular, constant negative criticism and ridicule may thwart subordinates' sense of autonomy, as they may behave in the manner that their supervisors desire in order to avoid being ridiculed. In addition, constant reminders of subordinates' past mistakes and failures, or not giving them the credit that they deserve, may lead subordinates to question their sense of competence in their job. Finally, ridiculing, excluding, or giving subordinates the silent treatment may thwart their sense of relatedness, as not being treated with trust, respect, and dignity may signify that they are not valued members of the group. To alleviate the aversive experience of thwarted needs, subordinates in turn engage in aggressive behaviors in the workplace such as taking breaks at work or sabotaging equipment.

Subordinate aggression following abusive supervision can also be explained via a social learning theory perspective (Bandura 1973). Social learning theory holds that people engage in certain behaviors as a result of observation of their environment. In an organization, supervisors can be viewed as role models. When supervisors engage in behaviors such as yelling and belittling employees, subordinates can learn from these behaviors and subsequently pattern these aggressive behaviors by engaging in aggressive behaviors themselves.

Another theory that explains the abuse-aggression relationship is the self-regulation impairment perspective (Thau and Mitchell 2010). Self-regulation theory posits that the ability of the self to exert control over itself is seemingly a distinctly human capacity that evolved from evolutionary pressures that arose from group living. Unlike other animals, which simply act on their impulses and desires, effective human functioning requires the capacity to transcend habitual behaviors, thoughts, urges, inner states, and emotions in order to flexibly behave in accordance with social and situational pressures as well as long-term goals or implications. For example, a subordinate's natural inclination after being abused by his/her supervisor may be to retaliate against the supervisor; however, the subordinate may have the willpower to resist the urge to retaliate. The self-regulation impairment theory posits that abusive supervision drains subordinates' self-regulation resources (i.e., willpower), making subordinates unable to override their habitual aggressive behavioral impulse; as such, subordinate self-regulation impairment serves to explain the relationship between abusive supervision and subsequent subordinate aggression.

Finally, the theory of displaced aggression may also shed light on the abuse-aggression relationship. When being mistreated by their supervisors,

subordinates want to directly retaliate against them. However, direct retaliation is not always possible, and oftentimes mistreated subordinates do not retaliate due to fears of escalating their supervisors' abusive treatment or fear of losing valuable resources (e.g., promotion opportunities). As such, abused employees sometimes displace their aggression at the organization, other coworkers, or even family members, as a way to relieve their frustration.

### Well-Being

Experiencing abusive supervision has profound implications for the mental and physical health of victims. Abusive supervision has been found to be positively related to subordinate psychological and mental health outcomes such as psychological distress (which includes anxiety, irritability, and depression), burnout, insomnia, lack of psychological need fulfillment, and decreased life satisfaction. Moreover, abusive supervision has been found to relate to subordinate health-undermining behaviors such as problem drinking behaviors. Perhaps a more troubling finding is that having an abusive supervisor can directly impact subordinate physical health. Research has found that subordinates who are often exposed to abusive supervision suffer from poor physical health in the form of increased psychosomatic and somatic complaints and physiological processes that undermine their physical health, such as higher blood pressure.

One main mechanism that explains the abusive supervision and well-being relationship is subordinate justice perceptions (Tepper 2000). Subordinates care about being treated with dignity and respect by authority figures, and they infer their social standing in a group from the treatment they receive. Being treated with dignity and respect by authority figures can convey positive social identity-relevant information and signify that one is a valued member in the workgroup or in the organization. Given the importance of justice, perceiving a lack of justice has profound implications for employees' health outcomes. For example, research has found that lack of justice perceptions is associated with greater emotional exhaustion, anxiety, stress, depression, insomnia, health complaints, the release of the stress hormone cortisol, and high blood pressure. When subordinates are under abusive treatment from their supervisor (e.g., constantly being ridiculed or yelled at), they perceive that their supervisor treats them with a lack of dignity and respect and does not see them as valuable individuals. Theory and supporting empirical studies have established that abusive supervision is negatively related to subordinate justice perceptions, and perceptions of lack of justice associated with abusive supervision in turn predicts subordinate well-being.

### Job Attitude and Job Performance

Abusive supervision has been shown to negatively impact subordinates' job attitudes. Subordinates under abusive supervision tend to experience decreased job satisfaction and commitment to the organization and increased absenteeism and intention to quit the organization. Abusive supervision is negatively related to both subordinates' self-rated and supervisor-rated in-role job performance and extra-role performance.

### Family Well-Being

Experiencing abusive supervision at work can spill over into employees' families and negatively affect a victim's family members' well-being. Employee perceived abusive supervision at work is related to employee work-family conflict and relationship tension at home. In addition, employee experience of abusive supervision at work is positively related to their spouse undermining behavior at home.

### Key Boundary Conditions of the Consequences of Abusive Supervision

**Subordinate-level factors.** Subordinate personality has been found to influence the relationship between abusive supervision and consequences of abusive supervision. For example, research has shown that subordinates who are both low in conscientiousness and low in agreeableness are more likely to use dysfunctional resistance tactics when being abused, such as ignoring their supervisor's requests. Subordinate self-control capacity is another factor that influences the relationship

between abusive supervision and subordinate aggression, such that subordinates with greater self-control capacity are less likely to engage in aggressive behaviors following abusive supervision. Subordinate attributions of abusive supervision have also been found to influence the consequences of abusive supervision. Studies have shown that when subordinates attribute abusive supervision to organizational factors, the positive relationship between abusive supervision and aggression directed at the organization is stronger. In addition, when subordinates attribute their supervisor's behaviors as intending to cause harm to them, they are less creative in their work. Other subordinate characteristics, including subordinate power distance, subordinate negative reciprocity belief, subordinate narcissism, subordinate gender differences, subordinate locus of control, subordinate emotional intelligence, have all been found to influence the relationship between abusive supervision and the consequences of abusive supervision.

**Supervisor-level factors** Supervisors also play a role in impacting abusive supervision and the consequences of abusive supervision. For example, leader-member exchange (LMX), or subordinates' perceptions of the overall quality of the relationship with their supervisor, has been found to influence the relationship between abusive supervision and subordinate aggression. In particular, the abuse-aggression relationship is stronger when subordinates have a higher quality relationship with their supervisor.

**Organizational- and group-level factors** Work unit structures can also influence abusive supervision and the consequences of abusive supervision. Studies have shown that following abusive supervision, employees report greater emotional exhaustion and lower contextual performance, and this relationship is stronger in mechanistic rather than organic work unit structures. In addition, group norms also play a role in influencing the consequences of abusive supervision, such that the abuse-aggression relationship is stronger when subordinates perceive their coworkers to be more approving of engaging in aggression in the workplace.

## Antecedents of Abusive Supervision

Abusive supervision is a serious organizational problem that merits attention from scholars to advance understanding of its causes and when and how such behaviors can be reduced. To fully eradicate the financial and psychological damage inflicted by abusive supervisors, it is important to understand what makes supervisors abuse their employees. There are three main perspectives in explaining why supervisors abuse their employees. Research on the antecedents of abusive supervision has primarily examined abusive supervision as a function of the mistreatment that a supervisor experiences at the hands of his/her own superiors (i.e., the "trickle-down" perspective; Mawritz et al. 2012). For example, previous studies have shown that when supervisors perceive injustice, psychological contract violation, or abusive supervision from their own supervisors, they are more likely to engage in abusive supervisory behaviors toward their subordinates. However, a limitation of the trickle-down perspective is that it alone cannot fully explain why supervisors engage in abusive supervision. For example, the trickle-down perspective suggests that once their supervisors have been mistreated, all subordinates have an equal chance of becoming the victims of abusive supervision; this supposition, however, is inconsistent with recent findings that subordinates with the same supervisor report different levels of abusive supervision, suggesting supervisors do not always abuse all subordinates equally.

Another perspective that explains why supervisors abuse subordinates is the victimization perspective, which suggests that individual subordinates may provoke aggressive supervisory responses through their own actions (Aquino and Thau 2009). For example, a poor performing subordinate or a subordinate who constantly disobeys the supervisor's requests may provoke the supervisor to engage in more abusive supervision toward only that particular subordinate but not the other subordinates. As such, there is more to abusive supervision antecedents than just the trickle-down perspective; rather, the employee's actions can also play a role in provoking

supervisory abuse. However, a limitation of the victimization perspective is that there is not a coherent theoretical framework to explain why supervisors abuse subordinates who are provocative.

More recently, an integrated perspective that advances the victimization perspective has been proposed and tested. From a dual-system self-control perspective, supervisors' abusive behaviors in reaction to subordinate provocation can be viewed as a failure to exhibit self-control (Liang et al. 2016). According to this view, abusive supervision emerges as the product of two systems: an impulsive system which represents the extent to which supervisors desire to lash out at provocative subordinates and a reflective system that represents the extent to which supervisors can exert control over their desire and override their abusive behaviors.

### Key Boundary Conditions of the Antecedents of Abusive Supervision

**Subordinate-level factors** Subordinate characteristics influence the extent to which supervisors engage in abusive supervision toward them. Research has shown that supervisors are more likely to abuse when subordinates perform poorly or when subordinates are high in negative affectivity.

**Supervisor-level factors** Supervisor characteristics influence the extent to which supervisors abuse subordinates. Research has shown that supervisors are more abusive toward subordinates when they themselves are low in trait self-control and mindfulness and high in hostile attribution and attribute their own supervisors' abuse toward them as intended to cause harm.

## Observing Abusive Supervision

Much of the research on abusive supervision has focused on the impact of abusive supervision on the victim, the supervisor, or the organization. However, abusive supervision also has profound consequences for third-party observers. Third-party observers are employees who have directly witnessed a supervisor engaging in abusive supervision targeted at another employee at work. Simply observing abusive supervision can lead to different third-party behavioral outcomes, such as helping the victim, aggressing against the supervisor on behalf of the victim to restore justice, distancing themselves from the victim, and even influencing victim reactions by assisting victims to make sense of their supervisor's behaviors.

In terms of understanding the mechanisms of third-party reactions to abusive supervision, there are three main theoretical perspectives that explain the reactions of a third-party observer of abusive supervision. The first theoretical perspective is the cost-and-benefit model. Upon witnessing abusive supervision, the third-party observer analyzes whether any reactions will be associated with any personal cost. In other words, whether the third-party observer takes any action is dependent on the risk associated with such actions. Another key theoretical perspective is the deontic perspective, whereby third-party observers who witness any forms of injustice are motivated to respond, regardless of the benefits and cost associated with their actions. Given that abusive supervision can be viewed as a violation of one's moral imperatives, third-party observers experience moral anger and are subsequently motivated to take actions to address the injustice. Finally, the scope of justice theory posits that the third party's perceptions of what is fair and unfair depends on their perceptions of the victim. If a third-party observer perceives the victim as being outside of his/her scope of justice, the third-party observer will consequently perceive the abuse to be justified and will derogate the victim instead of punishing the supervisor.

## Conclusion

Abusive supervision has detrimental effects for both individual organizational members and organizations as a whole. So what can organizations do to minimize the occurrence and the impact of abusive supervision? First, given the robust relationship between abusive supervision and subordinate aggressive behaviors, organizations may wish to select individuals (e.g., individuals with

high self-control capacity, individuals who are high in agreeableness and conscientiousness) who are less likely to react to abusive supervision with aggressive behaviors. Moreover, given that supervisors sometimes engage in abusive supervision with the intention to improve subordinate performance rather than causing harm to subordinates, organizations can also reduce subordinates' engagement in destructive vengeful behaviors by training subordinates to think about their supervisors' perspectives of abusive supervision, for example, attributing their supervisors' behaviors as helping them improve their performance rather than causing them harm. Additionally, given that the dual-system self-control perspective suggests abusive supervision is driven by desires that are too strong to be restrained, organizations may provide training to supervisors on how to reduce the strength of their experienced desires to harm subordinates and refrain from acting on such desires. Moreover, from a selection standpoint, organizations may be advised to select supervisors who are better at regulating their behaviors and would be less likely to act on their desire when faced with provocation from their subordinates.

# ACA Design: Rethinking Selznick

Reginald Shareef
Radford University, Radford, VA, USA
Virginia Tech, Blacksburg, VA, USA

## Synonyms

Affordable Care Act; Informal cooptation; Joint partnerships; Market efficiency; Pubic value; Selznick

## Definition

The Affordable Care Act – also known as *Obamacare* – was signed into law on March 10, 2010 and fundamentally changed health care in the United States through expansion of health insurance and reforms of the health care delivery system. *Cooptation* is a term created by Phillip Selznick that refers to a leadership process designed to manage opposition to organization change processes.

## Introduction: The Informal Cooptation Dilemma

In his January 23, 2016 weekly address, President Obama notes that since implementation of the

Affordable Care Act (ACA) in March 2010 (a) nearly 18 million Americans have gained coverage, (b) more than 90% of Americans are now covered by private insurance, and (c) health care inflation is at its lowest levels in 50 years. These are impressive numbers for such a controversial public policy and *begs* the question of exactly why has the ACA been successful. The Sufi Islamic parable of blind men attempting to describe an elephant provides an excellent analogy on how various social science disciplines attempt to understand the ACA.

Legal scholars identify the two US Supreme Court decisions upholding the individual mandate and tax credits as the causal variables for ACA success (see e.g., Mandel and Whaley 2015) while political economists focus on the relationship between politics and the creation of efficient health care markets (Shareef 1984). Public policy analysts utilizing Bozeman's (2002: 134–138) market efficiency/public failure framework (Shareef 2008) seek to determine if efficient ACA markets create public value or trigger public failure (Shareef 2014). Yet, it is Selznick's *sociology of public policy* (see e.g., Hill 1973: 240–245) that provides the most holistic sensemaking framework of the ACA. Indeed, President Obama's informal cooptation power-sharing arrangement with the health care companies is the antecedent to all legal, political economy and public policy analysis of the ACA.

Ever since sociologist Phillip Selznick's classic 1949 (219–238) study of leadership and the Tennessee Valley Authority (TVA), the concept of *cooptation* has been an administrative and cultural pejorative. Selznick (1948) discusses two types of cooptation. Formal cooptation occurs (a) when the leader brings in elements, (b) these new elements lend legitimacy to the change effort, and (c) what is shared is responsibility for power but not power itself.

Conversely, informal cooptation occurs when the threat is not gaining legitimacy for social change but where outside groups – because of the resources they command – demand a substantive decision-making role. Informal cooptation represents a unique phenomenon since formal power is divorced from social power and the legitimacy of formal authority is threatened. Unlike in formal cooptation processes, the leaders of these social organizations are fundamentally interested in the substance of power rather than its forms (Selznick 1948). Furthermore, because these leaders can divide loyalties and manipulate constituents, their demand for power-sharing requires accommodation by the change agent.

A contemporary variant of Selznick's informal cooptation form of leadership visioning is transactional leadership and manifests when the leader motivates stakeholders by appealing to self-interest via the exchange of benefits (Yukl 2013: 321). What distinguishes Selznick's informal cooptation leadership concept from transactional leadership is that the exchange between the change agent and stakeholders is always the same – a power-sharing accommodation. If structured properly in cases like the ACA, these power-sharing arrangements lead to win/win situations.

The 1990s Clinton health care reform initiative featured a hybrid financing system that allowed some states to either utilize a single-payer or private insurance plan to finance health care delivery (Kingdon 1995: 217–221). Yet, the health care insurance industry did not want any type of single-payer plan and sought to maintain a monopoly over financing in a reformed system. Consequently, they used their social power to turn public sentiment against the Clinton reform effort – especially in television commercials like the famous Harry and Louise Health Care Ads – by labeling the plan socialized medicine.

Additionally, President Clinton utilized formal cooptation of big business to give legitimacy to his health care reform change effort. In the Clinton health care initiative, big business shared in the responsibility of garnering public support for health reform and encouraging lawmakers to pass the legislation (Kingdon 1995: 218). However, the health care insurance industry – not big business – was the social power that threatened (and eventually destroyed) the Clinton initiative because their demands for power-sharing were not met.

President Obama – learning from the failed Clinton Administration's health care reform endeavor – used informal cooptation processes

to bring the health insurance industry into decision-making processes concerning the design of the ACA. In early and secret negotiations, the President negotiated an agreement that required the health insurance companies to provide universal coverage in exchange for the individual mandate. This powerful industry was receptive to the profit-making idea of the individual mandate ensuring 30-million new paying customers (most with guaranteed subsidizes) in exchange for popular up-front provisions including (a) universal coverage, (b) the Age 26 rule (i.e., children can stay on their parents group health policies until age 26), (c) the 80/20 rule (i.e., insurance companies must pay at least 80% of collected premiums on claims or a rebate check is sent to the policyholder), (d) removal of the $1,000,000 cap on health care policies, and (e) ending the odious practice of rescissions.

The President and large health care providers had completely different social and economic strategic objectives in agreeing to this power-sharing arrangement. The American health care industry is a classic profit-maximizing, Friedman-model enterprise that is primarily concerned with economic objectives, and compassion plays no role in decision-making (Tsui 2013). That is, their corporate strategy is guided by Milton Friedman's notion that corporations fulfill their social responsibility solely by maximizing profits, and any activities that distract from shareholder wealth creation is socially irresponsible (Tsui 2013).

However, the President's strategic and institutional visioning for the ACA was twofold: to provide universal coverage and preserve the market-based health insurance industry. Based on his observations at the TVA, Selznick (1957: 119) makes a distinction between organization and institution depending on the commitment to core organizing and unifying values. While organizations are rational tools of economic efficiency – and can be replaced by more efficient organizations (Hatch 2012) – it is the leader's responsibility to protect the "institution's distinctive values, competence, and role" (Selznick 1957: 119). The idea of universal health care coverage has been the *core value* of health care reform legislation since the beginning of the twentieth Century (Kingdon 1995: 217), and President Obama never compromised on this value in his informal cooptation of the health insurance industry. Consequently, Obama's leadership commitment to universal coverage access fits Selznick's (1957: 90) "institutional embodiment of purpose." Importantly, the key leadership activity that allowed the President to maintain this institutional purpose was the informal cooptation of the health care industry.

Selznick (1948) suggests that institutional leaders (in this case President Obama) cannot openly acknowledge the sharing of decision-making with powerful social forces; otherwise, the legitimacy of formal power will be eroded. Thus, the necessity for secret negotiations between the President/Senate Finance Committee and the health care industry. Moreover, the President's choices were initially constrained as he engaged in the informal cooptation of industry representatives. For instance, he favored the public option – a government run health agency to compete with private health companies – but the health insurance companies demanded Senator Max Baucus veto that idea in the Senate Finance Committee (Drier 2009).

Selznick (1948) also found that cooptation directly impacts leadership choices: "The character of the co-opted elements will necessarily shape (inhibit or broaden) the modes of action available to the leadership which has won adaption and security at the price of commitment." Most often, cooptation inhibits leadership activity. For those like Klein (2009), the informal cooptation of the health care insurance industry by the Obama Administration narrowed the President's choices as the public option was eliminated from health care reform.

Yet, the individual mandate provision demanded by the health industry also constrained their choices and, interestingly, actually expanded those of the President. By negotiating the early implementation of popular elements of the ACA like the Age 26 and 80/20 rules, ending rescissions, etc. in 2010 – with the more controversial individual mandate and monetary fine for not purchasing health insurance coming 4 years

later – President Obama was able to avoid Thurow's (1980: 15) lethal zero-sum economic game where decision-makers incur costs first with benefits only coming later. These upfront costs often cause politicians to lose elections and are normally avoided (Thurow 1980: 15).

Thaler and Sunstein (2008: 165–168) found this zero-sum equation plagued President Bush's implementation of Medicare Part D in 2006. Because of informational overload concerning enrollment of the elderly in the new prescription program, initial switching costs were extremely high for Medicare beneficiaries with the benefits of dramatically lowered prescription costs coming 2 years later. Consequently, the Medicare Part D prescription plan was extremely unpopular with seniors in its early years (Thaler and Sunstein 2008: 162–165).

On the other hand, President Obama's negotiations with the health care industry led to the immediate implementation of the aforementioned popular (and essentially costless to consumers) provisions of the ACA and were the catalyst for a *benefits now/costs later* equation that features an extremely efficient type of choice architecture (Thaler and Sunstein 2008: 73).

Selznick 's (1948) research suggests the inhibiting or broadening of choices for formal leadership in informal cooptation processes generally flowing in one direction; that is, leaders tend to cede power to powerful outside interests. Yet, informal cooptation in the evolution of the ACA offers an interesting paradox. As the President conceded on the public option in favor of the industry's individual mandate demand, he extracted numerous popular health care provisions that – now implemented as public policy and deemed socially legitimate – are unlikely to ever be taken from consumers in the health care market since popular public policy benefits are rarely later eliminated (see Dye 1978: 33).

The use of informal cooptation/power-sharing arrangements is certainly an emerging trend in public-private partnerships. For example, successful public/private partnerships like the USPS/UPS "Blue and Brown Make Green" business alliance – a unique partnership between these two companies to provide better service, reduce greenhouse emissions, and enhance operating efficiencies – features all of the hallmarks of an informal cooptation power-sharing arrangement negotiated between USPS Postmaster General Patrick Donahoe and UPS CEO Scott Davis. Moreover, this joint venture fits in the category of a business enterprise where both social and economic outcomes are co-equal strategic objectives (Tsui 2013) and trigger public value (Shareef 2010).

Hence, the institutional dilemma of utilizing leadership informal cooptation/power-sharing in joint ventures does not concern the efficacy or ethics of this lead change variable but rather the negative social construction of the concept of cooptation.

## Resolving the Informal Cooptation Dilemma

The negative construction of the Selznick's cooptation concept is especially true in the field of Public Administration & Policy. O'Toole's and Meier's (2003) comments are instructive:

> Decades of research have validated the point that agencies and their management must develop support in their setting, and that doing so can mean sacrificing the primary agenda of policy, particularly if it involves social change, in the interests of survival. This theme is the primary contribution of Selznick, particularly in his classic study *TVA and the Grass Roots* (1949), a book in which the notion of cooptation was defined and illustrated with exactitude through the TVA's struggle for institutionalization in a turbulent setting. Leadership of the TVA in effect ceded their agricultural policy goals to powerful local interests in exchange for political support that was then used to push TVA's electrical power agenda."

Many doctoral students in public administration have never been taught the difference between Selznick's formal and informal cooptation. However, they have been taught and socialized to believe that there is a *deterministic* relationship between cooptation and institutionalization (i.e., the cooptation of institutional values by powerful outside interests). Hatch (2012: 36) explains why institutionalization exists:

> "What then explains the perpetuity of non-rational organizations like the TVA? Selznick offered the concept of institutionalization as his answer, claiming that institutions make themselves appear indispensable by asserting their value to society, something the TVA did in the U.S. by linking itself to the idea of grassroots democracy, in spite of fact that its behavior diverged significantly from the expectations set by this claim to legitimacy."

Yet, Selznick (1957: 90) also provides the antidote to institutionalization – the leader not being co-opted by outside interests while maintaining the "institutional embodiment of purpose." As mentioned earlier, President Obama never compromised on the institutional value of universal health coverage and therefore was never co-opted by the health insurance industry. Consequently, if leaders maintain core institutional values in negotiating power-sharing arrangements in informal cooptation processes, the leadership process is very *anti-deterministic*.

Terry (1999), in his discussion of neo-managerialism and democratic governance, finds that even when linguistic reinterpretations of existing management concepts occur, the reconstituted construct still inherits the underlying assumptions and meanings of the old concept. Shareef (2010) also reports that the socially constructed embedded meanings of management language rarely change despite linguistic reinterpretations or reconstituted paradigms. Thus, it is unlikely that the informal cooptation leadership concept will shed the negative connotations (in either academia or the broader society) of determinism and institutionalization despite empirical evidence to the contrary.

Miller's (2006) research on confirmation bias in management journal publishing finds that reviewers reject manuscripts when they are unfamiliar with new concepts or novel interpretations of old concepts. Given this type of institutional bias, researchers studying public policy innovations that utilize Selznick's informal change processes may be best served by simply subsuming the informal cooptation concept under Kanter's (1989) PALs (pooling, allying, and linking) construct where organizations seek opportunities for growth by allying through joint ventures with other organizations. For instance, the informal cooptation of the health care industry by the President is congruent with what Kanter (1989; p. 186) calls *Stakeholder Alliances* or ". . . complimentary coalitions among a number of stakeholders in a business process who are involved in different stages of the value-creation chain." The joint USPS/UPS public-private partnership – triggered by Selznick's informal cooptation process – fits with Kanter's socially acceptable PALs construct.

## Conclusion

Social scientists attempt to study the ACA from the viewpoint of their various disciplines. This approach provides a segmented analysis of health care reform. However, viewing this successful reform through the lens of Selznick's informal cooptation process provides a more holistic understanding of how leadership visioning and power-sharing with former adversaries can create desirable social and economic outcomes for all stakeholders. Simply put, the informal cooptation process that is the catalyst for this leadership visioning appeals to varied stakeholder self-interests and requires the exchange of a single currency – power-sharing by the change agent in the design of the stakeholder alliance.

Neither formal or informal cooptation are inherently deterministic or lead to institutionalization. The leader avoids these dysfunctions by maintaining the institution's strategic objectives/core values during negotiations in the design of the power-sharing framework. In other words, the leader initiating informal cooptation must avoid being co-opted by outside stakeholders.

In an era where the success of public policy is evaluated on whether Public Value is created and public-private partnerships are the norm, the ACA is a model for producing both market efficiency and valued social outcomes. The linchpin for this success is Selznick's informal cooptation process. Regardless of whether the name transactional leadership or PALs attaches to informal cooptation processes, it appears the time has come for public policy scholars to seriously reassess Selznick's leadership concepts of

(a) informal cooptation and (b) the institutional embodiment of purpose for their efficacy in creating Public Value in joint partnership ventures.

## Synonyms

Association; Group; Organization; Society

## Definition

| | |
|---|---|
| Association | Organization of people with a common purpose and formal structure |
| Academic association | Membership mostly consists of university faculty |
| Professional association | Membership mostly consists of mid- and upper-level employees |

## Introduction

Professional and academic associations are essential institutions for the advancement of

knowledge and skills, both in academia and respective professional fields. Well-managed associations provide rich platforms where new research and ideas can be exchanged, new policy proposals discussed, and best practices examined. The high-tech revolution is introducing complex changes in software and hardware and related innovations at a rapid pace, and associations can use their resources to help members stay on top of unfolding developments.

## International Public Management Association for Human Resources (IPMA-HR)

The International Public Management Association for Human Resources (2017) was founded in 1906 and over the years achieved a leading position on public sector HRM. Its mission is: "Enhance public sector performance by providing human resource leadership, advocacy, professional development, and a community of HR professionals for the sharing of resources and ideas."

IPMA-HR is a very important resource for public sector human resource management (HRM). Its support efforts include an annual training conference and expo, strategic webinars on current and emerging issues, as well as publications in the form of books, magazines, and journals dealing with salient issues in public personnel administration. The association also offers two certification programs:

1. IPMA-HR senior certified professional for managers, directors, senior management or executive level
2. IPMA-HR certified professional for entry- or mid-level career positions

The organization supplies extensive material on its website to prepare for the certification.

Another important function involves testing material for government jobs that have been controversial in the past. IPMA-HR is an experienced provider of public safety tests for police, fire, emergency communications centers, corrections, and administrative support. Its website states that its tests have been validated.

The association brings to the fore the competence and expertise of public HR professionals from all over the country by asking them to submit innovative personnel procedures. The findings are then aggregated and made available to the whole membership. This opportunity is especially helpful in the information age. To make effective use of what the high-tech revolution has to offer, new job classifications are being created and new testing procedures are being introduced. The collaboration among HR specialists enables the thoughtful exchange of what works and what doesn't. This exchange is especially useful for HR professionals in smaller and more rural jurisdictions, where they may be the only HR expert and where they may have few opportunities to consult colleagues.

Another platform for sharing is provided by chapters. The association is subdivided into 40 local chapters where members can network in person and get more locally targeted training.

As the description of resources indicates, IPMA-HR offers extensive services for immediate HR needs, as well as long-term strategies for growth and improvements.

## Society for Human Resource Management (SHRM)

The private sector equivalent of IPMA-HR is the Society for Human Resource Management (2017). It also offers annual conferences, webinars, publications, and certification programs. Topics covered on its website range from behavioral competencies to technologies. Its business solutions extend from benchmarking service to vendor directory. Under tools and samples, it posts forms and documents. Since the number of employers and employees is much higher in the private sector, SHRM is a much larger association with many more members and many more resources. Also, private-sector employers vary much more than in the public sector, which increases the complexity of private-sector organizations and their professional needs.

Employment law in the private sector is very different from public sector regulations. The most important difference is job security. Private sector employees are usually hired under the at-will clause, while most public employees become civil servants with job security after a probationary period. This difference impacts many other employment decisions, for instance, hiring and promotion decisions. Private-sector employment is regulated by the federal government and the states, and SHRM's website devotes a section on employment law. Public employment is much more uniform among jurisdictions and subject to transparency requirements. That makes sharing of HR policies and other personnel issues via the internet much easier in the public sector.

Another important difference involves political action. The IPMA-HR website is only concerned about professional issues, while SHRM devotes an extensive part of its website to political action. It repeatedly and loudly calls on its members to "take action" when Congress debates a bill of interest to private-sector employment. Despite the many differences, consulting the resources and activities of SHRM is useful for public employers if only to compare approaches and learn about private-sector initiatives.

## American Society for Public Administration (ASPA)

The American Society for Public Administration (2017), founded in 1939, is a very important organization for public-sector professionals and respective academics. It states on its website that it "serves as the principal arena for linking theory and practice within the field of public administration." The Society has about 8,000 members consisting of practitioners, academics, and students. Members come from the three levels of government in the United States and 49 other countries, such as Canada, China, Ghana, Japan, and Nigeria. To meet the diverse information needs of its members, ASPA is divided into 30 sections, one of which is the Section on Personnel Administration and Labor Relations (SPALR). ASPA has also supported the creation of chapters, which are geographical units where members can network in person and share information about local issues.

Like the other associations, ASPA maintains a variety of resources for its members. It holds annual conferences, issues several publications, offers webinars, and participates in other relevant engagements. SPALR publishes its own journal, the *Review of Public Personnel Administration*. It is a scholarly, peer-reviewed journal and appears quarterly.

ASPA's other publications also run articles of interest to HR scholars and practitioners. The most important journal is the *Public Administration Review*, which is peer-reviewed and appears bimonthly, that is six issues per year. *Public Integrity* specializes on ethical issues. *PA Times*, available as magazine and online, covers recent developments of interest to public administrators. The ASPA book series discusses topics of interest to public administrators. One title of special interest to HR professionals is *Practical Human Resources for Public Managers: A Case Study Approach*.

At the outset, in 1939, ASPA was charged with an important mission – to strengthen the professionalism of the public service, especially at the executive level. The Great Depression and the New Deal legislation under President Roosevelt had substantially expanded federal programs, but effective implementation was lacking. A newly constituted task force, the Committee on Administrative Management, also known as the Brownlow Committee, identified executive level training needs and ASPA was introduced. Founding members included notable contributors to the field of public administration, among them Louis Brownlow, William E. Mosher, Donald C. Stone, Charles A. Beard, Harold D. Smith, and Luther Gulick.

At the beginning, ASPA had an applied focus, but over the years, it attracted faculty from the newly created Public Administration programs, and it incorporated the academic needs of faculty. However, some scholars had a more theoretical and critical orientation, and they created their own academic home, the Public Administration Theory Network.

## Public Administration Theory Network (PA Theory Network)

Formed in 1978, the Public Administration Theory Network (2017) set out to strengthen the intellectual underpinnings of public administration theory and practice. Its members have critically debated American scholarship, as well as works of European critical social theorists, sometimes called postmodern theory (Farmer 2005; Wamsley and Wolf 1996). Personnel issues became part of their research interest, for instance, the alienation of the bureaucrat has been explored by Hummel (2007). The Network has its own journal, *Administrative Theory & Praxis*, and hosts an annual conference. Its membership includes academics and public service professionals from the United States and from around the globe.

## International City/County Management Association (ICMA)

The International City/County Management Association (2017) was founded in 1914 as a professional home for city managers. It was during a time when the reform or progressive movement sought to replace the patronage or spoils system, and the appointment of city managers was a strong signal that cities would be managed by competent, ethical, and politically neutral public administrators. Originally, the managers came from civil engineering or other professional fields; but with the growth of Master's degree programs in Public Administration across the country, the MPA is now the preferred degree for managers and executives in local government.

ICMA grew with the expanding academic field and the buildup of cities. Its "mission is to create excellence in local governance by developing and fostering professional management to build better communities." To achieve its goals, ICMA offers a great variety of professional services that allow public employees stay engaged and current in their field. The ICMA Press offers many titles for training and education. One area of focus is human resource management in local government (Freyss 2009).

Other professional opportunities include the annual conference, webinars, and workshops. ICMA creates organizational platforms where members can network, and it matches retired managers with individuals new to the field. ICMA offers internships, leadership development programs, and a voluntary credentialing program.

The membership of ICMA is well aware that its actions have an important role to play in the quality of life at the local level, and ICMA provides many resources so that local government employers and employees can execute their responsibilities successfully. ICMA has also recognized that its extensive knowledge about local government may be useful abroad and has embraced international connections.

## Conclusion

The high-tech revolution and constant changes in the information age are making the work of government more complex. Getting a good education is an essential foundation, but not enough – it will be obsolete quickly after graduation. To stay on top, the idea of life-long learning has become a reality. Academic and professional associations play important roles in creating learning communities for adults. The organizations covered here understand the importance of their role and have accepted the challenge. They also recognize the importance of diverse learning opportunities and have embraced a variety communication channels.

### Synonyms

Discipline-based service; Institutional service; Public engagement; Public service; Service

### Definition

Academic citizenship refers to the service that academics perform for their institution, the scientific community, and the larger society.

### Introduction

Academic citizenship can be defined as the service that academics carry out to benefit the higher education institution they belong to, the scientific community, and the wider society. Academic citizenship, also called service, is necessary for university functioning and development as well as for reinforcing the connections of universities to the collectivity they are embedded within, thus disrupting the view of higher education systems as secluded portions of society or "ivory towers."

This entry will delve into the various interpretations of academic citizenship that have been provided and the different types of academic citizenship that have been acknowledged in the literature. It will then parse out its antecedents, distinguishing between individual and organizational-level factors that foster or hamper the enactment of service. The relationship between academic citizenship and other faculty roles and activities will be analyzed, and how academic citizenship is valued and rewarded will be discussed.

### The Meanings of Academic Citizenship

Academic citizenship represents, alongside research and teaching, a core faculty engagement. In the reflection on higher education, these three sets of activities have been traced back first to a "tripartite vision" of the academic profession, in which they would have a similar weight and relevance (Austin 2002), and then to a "contested triad" (Pifer and Baker 2013) in which, while requirements about research are clearly stated and the teaching work load is defined, service expectations have gradually become blurred. Although academic citizenship continues being necessary for organizational thriving, it has then been often sidelined in the debate on higher education.

Different interpretations of academic citizenship have been offered in the literature. At an aggregate level, according to a largely embraced classification, academic citizenship can be distinguished between institutional service, discipline-based service, and public service (Lawrence et al. 2012). Institutional service comprises activities and roles that academics perform targeting the institution they are affiliated to: membership of committees and Senate, directorship of

undergraduate and graduate programs, acting as head of department or school dean, and participation in "open days" are all examples of institutional service that allow for university management. Discipline-based or professional service instead addresses the scientific community an academic belongs to and consists of a variety of tasks that are beneficial to knowledge sharing processes among scholars, such as participating in conferences' scientific and organizing committees, being a reviewer for journals, taking charge of scientific associations' dissemination through newsletters and website management, and editorship of journals. Finally, public service concerns the activities and roles that academics play out on behalf of their own institution to address the larger collective within which universities are nested: often also labeled as public engagement, it ranges from representation on the media to sitting on boards or committees of public and nonprofit organizations and to giving lectures or contributing to round tables and workshops for nonexpert audiences.

A more fine-grained view of academic citizenship structures academic citizenship according to a "service pyramid" that is made of five different layers (Macfarlane 2007): at the bottom level, student service (e.g., acting as a student counsellor, coaching students for job interviews) can be found, followed by collegial service (e.g., mentoring colleagues, contributing to "open days"), institutional service (e.g., being the director of a degree program or a member of the university Senate), discipline-based or professional service (e.g., organizing an academic conference, acting as a peer reviewer or journal editor), and public service, which represents the top layer (e.g., taking care of dissemination to the public, advising public and charitable organizations). Distinction between types of service is based on status, which can be attributed to the perception of their scholarly nature, with professional service ranking higher than service to students, to their being internal or external to the university, with the latter being more prestigious than the former, and the extent to which they are visible or even rewarded in terms of career, with their appeal increasing when they are evident to the public or explicitly compensated.

Service beyond university boundaries or public service is gaining relevance in a perspective of higher education that is growingly intertwined with society and no longer an isolated "ivory tower." A meaningful metaphor used to describe the active role played by higher education institutions in the collective is that of the "placeful university," i.e., universities transcending their organizational and tangible borders (e.g., campuses) to foster intensive relationships with other institutional actors aimed at taking joint decisions (Nørgård and Bengtsen 2016). It is worth stressing that from this viewpoint, public service differs from knowledge transfer in that public service can trigger bidirectional exchanges of ideas between universities and the larger society to make mutually beneficial decisions, whereas knowledge transfer focuses mostly on unidirectional flows in which the knowledge produced by universities is conveyed, through suitable translation actions, to other public or private actors.

In spite of the similar labels, it is worth underlining that academic citizenship differs from organizational citizenship behaviors, too. Organizational citizenship behaviors refer to behaviors that are intentionally chosen and played out by organizational members with the aim of benefiting their organization without direct or explicit expectations of reward (Organ et al. 2005). Examples are help to a colleague who faces some difficulties in his or her work, taking part in social events or speaking well of the employing company with outsiders. Besides the inner difference between these instances of organizational behaviors on one side and institutional, professional, and public service described above, on the other, the voluntary nature and the lack of or faint expectations of some return have to be taken into account. Academic citizenship is part of the academic profession together with teaching and research, is often formally required by university management, and carries with it prospects about opportunities of career advancement or compensation gain, while organizational citizenship behaviors stem from positive attitudes toward the job or the organization like job satisfaction and organizational commitment that lead individuals to wish to contribute actively to

organizational thriving. Unlike organizational citizenship behaviors therefore, academic citizenship targets core roles and tasks of faculty that can be only marginally discretionary.

## Determinants of Academic Citizenship

The enactment of academic citizenship can be explained in terms of individual and contextual features. Among individual characteristics, academic rank and gender appear to be influential. Concerning academic rank, different types of service have been linked to different hierarchical positions. Full professors have been posited to take charge of public service especially, since it is more visible than institutional and professional service and confers prestige outside the academic world only. Conversely, assistant professors tend to be shielded from academic citizenship to be able to devote their time and effort to research, which is the main basis for career progression in tenure track. They can be involved, however, in some discipline-based service as it is considered to be, among the types of academic service, the one most akin and complementary to research. Assistant professors in fact often act as reviewers for conferences and journals or participate in the organization of workshops. It is associate professors therefore who are usually expected to engage in most institutional service, which is demanding and looks scarcely appealing to those who are not members of the academia (Guarino and Borden 2017). Considerations on academic rank are coupled with speculation on the effect of gender on service. The "gendered nature of service" has been argued: female faculty appear to take care of shared resources, up to the point that they are deemed to do "institutional housekeeping" (O'Meara et al. 2019). A few explanations have been offered with regard to women's willingness to play out academic citizenship. Social biases have been evoked: female faculty find it hard to turn down proposals to enter committees and boards, as they are expected to be nurturing by colleagues as well as by students. On top of that, they are also less incline to negotiate their position and compensation compared to their male counterparts, accepting to carry out "non-promotable" tasks like most service, as will be fleshed out below (Guarino and Borden 2017). In addition, gendered expectations address research compared to service performance: an implicit role separation often occurs in academia, with men privileging research achievements, while women take charge of managing organizational processes (Larivière et al. 2011). This observation is rooted in evidence collected in multiple settings and through multiple data collection techniques, such as cross-sectional faculty surveys, annual faculty activity reports, surveys, interviews, focus groups, and time diary studies (O'Meara et al. 2019). A study by Misra et al. (2011) showed that female associate professors would spend about 25% of their time on research in comparison to 37% of men, testifying to the different service effort. Other studies on women's participation in decision-making processes resonate with the emergent evidence that they undertake the majority of academic citizenship: women serve more often than their male colleagues as members of boards and committees, although a reverse trend applies to responsibilities. Chair are in fact more frequently male than female faculty (Guarino and Borden 2017). A gender issue has been detected also with regard to department head and percentage of female faculty in a department: the amount of service performed by women increases as the head of department is a man and women are a minority in the setting. Under these circumstances, women have turned out to be in charge of the greatest volume of academic citizenship (Guarino and Borden 2017).

Besides actually receiving a larger number of formal requests, women tend to volunteer more than men to enact service, too, and when academic citizenship is played out by men, these latter stick to those types that can grant them some prestige and visibility like discipline-based and public service. Still focusing on female faculty, it is remarkable that the highest service load pertains to female associate professors, who are significantly more active than full professors of the same gender (Babcock et al. 2017). Female associate professors can be so involved in service performance that they can end up jeopardizing their career

opportunities (Misra et al. 2011). In conclusion, regarding the influence of individual features on academic citizenship, gender and position lead to a polarization of behaviors: male full professors tend to be quite selective and oriented toward visible and prestigious service, while female associate professors perform most service of all types.

Contextual characteristics play a role in steering faculty toward, or away from, academic citizenship. In particular, university orientation to research, university size, and department heterogeneity have been called into question. As far as university orientation to research is concerned, the more focused higher education institutions are on research performance, the less faculty are inclined to undertake service. Service, with the sole likely exception of discipline-based role and activities, is in fact viewed as a distraction from or even as an obstacle to the attainment of satisfying publication record (Macfarlane 2011). Conversely, comprehensive universities sponsor the relevance of teaching and service; consequently, faculty are expected and encouraged to engage in their performance (Porter 2007). Concerning size, service is believed to be related to organizational dimension. Individuals are likelier to develop a sense of belongingness to small in comparison to large organizations (Macfarlane 2007): in small universities, academics are more committed and willing to perform tasks that may benefit their organization, whereas in large universities, faculty tend to refrain from service. Individualism prevails over collegiality in large universities, thus undermining academic citizenship. In addition, big-sized universities can make institutional service less exclusive and visible, since a greater number of coordination roles are needed and available, than in small-sized institutions, further reducing their appeal especially to male faculty. Consequently, women's academic citizenship load, and that of associate professors in particular, likely increases in these contexts.

As regards department heterogeneity, in departments covering more disciplines, faculty are believed to be reluctant to engage in service that might bring some advantage to colleagues in other disciplines, reducing these latter's duties and leaving them more time for research (Macfarlane 2007).

## The Interplay Between Academic Citizenship and Research

The recent decline of academic citizenship has been traced back to the increasing relevance of research performance in most higher education systems (Macfarlane 2007, 2011; Vogelgesang et al. 2010; Nørgård and Bengtsen 2016). The emphasis on research is due to a multiplicity of concurrent factors: the evidence that research outcomes are able to sustain countries' economic and societal development, the need to promote transparency and accountability in higher education systems through research performance-based evaluation systems, and the search for more efficiency through allocation processes depending on research performance.

A substitution effect or trade-off has been called into question between research and service: actions aimed at improving the publication record divert attention away from institutional and public service, while the relationship between research and discipline-based service can be complementary as they both target the scientific community. Among the rationales for a possible trade-off between research and service, a survey on British faculty conducted by Abreu et al. (2009) highlighted the role played by lack of time, an excess of bureaucracy that encroaches upon efficient time management, and scarcely motivating rewards. The substitutable effort between research and service in general has led scholars to theorize about the effects of the focus on research achievements that academics have been embracing. It has been even conjectures that in contemporary universities, faculty who undertake service are those who are past their prime in research and look for alternative ways of taking center stage (Thompson et al. 2005).

Faculty have been argued to try to lessen their engagement in service that is being appropriated by other professionals. Concentrated on their research objectives, scholars are gradually dismissing their professional identity as all-rounders (researchers, instructors, and public servants) to stress the research component: the expressions "unbundling" and "hollowing out" have been harnessed to refer to the fact that

many traditional activities and roles are left behind in the pursuit of research excellence. The relinquishing of service by faculty has prompted changes in academic professionals. Some activities and roles, such as student skills advisers, educational developers, and learning technologists, are being increasingly assigned to especially hired professionals whom Macfarlane (2011) labeled as "para-academics." In parallel, the work and competencies of some administrative staff are being enriched to help academics do better research: the so-called blended professionals are in fact administrative personnel who assist faculty with developing networks for research projects, writing project bids, and managing research funds once projects have been won. Eventually, the rising attention for research performance has had a remarkable impact upon academia, at the same time depleting faculty of some of their tasks and roles, enhancing administrative staff's jobs, and paving the way for new professional profiles.

## Valorization of Academic Citizenship

Although, as reported above, academic citizenship is a kernel of the academic profession, how it is recognized and rewarded largely varies from institution to institution and from higher education system to higher education system. "Foggy" policies surround academic citizenship enactment. Many authors have argued that service requirements and rewards are largely neglected in contemporary university management (e.g., Thompson et al. 2005; Macfarlane 2011; O'Meara et al. 2019): while research performance has taken center stage and teaching loads are usually defined on a yearly basis (for instance, 120 h for Italian associate and full professors), criteria for service allocation and compensation remain mostly obscure. Data collected and analyzed by O'Meara and coauthors (2019) showed that faculty in STEM (Science, Technology, Engineering, and Mathematics) departments located in 16 US public institutions tended to be scarcely satisfied with service attribution and enactment: only less than half of them stated that service assignments were fair, criteria for appointing faculty to boards and committees were clear, and participation was stimulating.

Different proposals have been formulated to clarify how to attribute and value academic citizenship, with the goal of revamping the importance of this component of the academic profession. Thompson et al. (2005) articulated a multiple-step process to first realize what kind of service faculty is actually engaged in and how much involved in service they are. To do so, they depicted various stages that university management should pursue. The first phase calls for advertisement of service requirements in job openings. When opening positions in fact, universities should clearly specify what academic citizenship roles and tasks candidates are asked to carry out. Second, service should be expressed in terms of indicators of quality expected. To develop these indicators, a survey should be conducted investigating the kind of service really performed and the amount of time devoted to each type of service by every academic. Based on this inquiry, average time can be assessed and employed as reference of adequate service to be granted tenure, with assistant professors being less charged than senior colleagues. Consequently, different rewards should be established to match different levels of academic citizenship. Additionally, the authors advise to organize regularly workshops to assist faculty with academic citizenship enactment and with management of the various activities and roles required. Finally, universities should continuously monitor the state of the art of the service played out to identify and rule out redundant tasks and better overall functioning and coordination.

A different perspective on how to provide impetus to academic citizenship was conveyed by O'Meara and coauthors (2019). In line with the process depicted by Thompson et al. (2005), they recommend that minimal levels of service be defined and undoubtedly communicated to reduce the likelihood of social biases. Furthermore, they foster a procedure according to which faculty are assigned a given amount of credits – depending on their rank – that they can trade with colleagues, provided that minimal levels in each of the three core areas (teaching, research, and academic

citizenship) are met and the head of department provides his or her approval. Some academics could exchange credits in research in favor of more involvement with teaching, whereas others could prefer more service to research. From still another viewpoint, a possible scenario holds that departments be made of individuals with heterogeneous capabilities who excel in different tasks and roles: some outperform colleagues in research, others in teaching, and others yet in academic citizenship. Department as a whole is excellent in the range of activities necessary to run the academia, but not all members are excellent in each activity. This organizational arrangement resonates with most companies' functioning based on a specialization criterion: individuals have heterogeneous competencies in which they try to attain the highest performance. This setup is aligned with the "credit trading" perspective raised by O'Meara et al. (2019) but calls into question university management's organizational design that acknowledges different domains of expertise (research, teaching, and service) and groups faculty accordingly to foster excellence in each of them, rather than faculty negotiating their engagements and discussing arrangements with heads of department from time to time.

Finally, departments can boost equity through a planned rotation of less promotable and demanding roles and of more preferred and prestigious roles, so that there is equity in service over time within a single context. Rotation would in fact serve to disrupt consolidate patterns according to which always the same department members, who usually are female associate professors, tend to be asked repeatedly, or repeatedly volunteer, to take care of academic citizenship.

The need for revamping the relevance of academic citizenship through one of the courses of action reported above is rooted in the observation that service carries with it participation in decision-making processes: sitting on universities or external organizations' boards and committees, directing programs, or acting as journal editors and reviewers, as a matter of fact implies steering decisions that impact upon institutional mission and identity. Refraining from active involvement in academic citizenship therefore entails marginalization in decision-making about governance or, as noted by Thompson et al. (2005), Guarino and Borden (2017), and O'Meara et al. (2019), that influence is exerted by a restricted number of individuals who, in return for the effort devoted, can turn into a dominant coalition over time.

## Conclusion

Academic citizenship is the service that faculty perform for the sake and on behalf of their employing institution and consists of roles and tasks addressing the university, the scientific community, and the society at large. Alongside research and teaching, academic citizenship has traditionally been part of the academic profession, even though its importance has been gradually sidelined by the attention devoted to research performance internationally. A substitution effort or trade-off has been evoked to take place among the various components of academic life: as a consequence of the growing emphasis placed on research performance in higher education systems, faculty feel the drive to direct their effort and time toward research-oriented activities, reducing or dismissing other roles and tasks, especially those linked to academic citizenship. Some studies have claimed that service enactment be related to individual characteristics like rank and gender and to contextual features like university orientation to research, university size, and department heterogeneity. While male faculty tend to select only visible and prestigious service and assistant professors are usually protected from its enactment as they must prioritize research, it is female associate professors who take charge of most service. Additionally, strong university orientation to research, large university size, and department heterogeneity are all factors preventing individuals from undertaking academic citizenship. Clear requirements and incentives to perform service have to be designed and applied, then. Reflection on academic citizenship has identified possible pathways to sustain its importance. A rotation plan can be set up so that unappealing roles and activities are carried out by all department members throughout time. Alternatively,

faculty can be assigned an amount of credits, with minimum levels assigned to research, teaching, and service that can be negotiated with colleagues and head of department to obtain more credits in one domain and less in the other. Moving beyond trading credits, specialization of individuals in research, teaching, or service, with regularly occurring revisions, can be designed by department management, with the goal of making department excellent as a whole through members who excel in different domain. It is noteworthy that academics should invest in service since it strongly influences governance choices within and outside university boundaries.

Endowments; Enrollment; Pandemic; Scholarships; Tier 1

## Introduction

The global pandemic and the 2020–2021 school year for many US colleges and universities is an inflection point. Many academic institutions of higher education were unsure how to manage the on-campus experience or whether to remain an online teaching academy or have a hybrid experience. A recent article in *The Chronicle of Higher Education* referenced 1,075 colleges and their plans on what the 2020–2021 academic year would look like, and their responses were mixed: 61% in-person, 22% hybrid model, 8% online, 6% range of scenarios, and 2.7% waiting to decide (April 23, 2020).

The academic year is underway and the academic scenario continues to unfold. This has been a stressful school year in and out of the classroom. The continuing constant is students will need financial support to continue their academic pursuits. The financial support will come from their parents, on-campus or off-campus employment, or financial aid. The landscape during the 2020–2021 academic year will look decidedly different than in prior years due to COVID-19. And with the high unemployment rate, the prospect of parental support may be an unthinkable proposition for many students.

Many institutions are re-evaluating their role in society and how they can be a catalyst for change. Nonprofit organizations, governments, profit-making organizations, cultural institutions, healthcare, and religious organizations are clamoring and initiating ways that will make them better communal citizens.

## Better Academic Citizens

There are 1,845 institutions of higher education that are considered private in the United States. Of these select group of private schools that bestow undergraduate and graduate degrees, the financial cost is prohibitive unless the student's family is wealthy or the student receives considerable amounts of financial aid, loans, or must work.

The authors reviewed universities with the largest endowments. Before we begin our discussion about the need to eliminate financial worry and burden from students, the authors reviewed important concepts to lay the groundwork and introduce important concepts. Several words and concepts need to be understood before delving more deeply into the sources of academic institutional sustenance.

## Endowments

An *endowment* is a broad term that is often used to describe the total of one or more endowed funds. An endowed fund is a charitable gift established in perpetuity in which the principal is invested for total return (both income and appreciation) and a small portion of the fund's balance (usually 4–6%) is paid out, generally on an annual basis. The *beginning principal* is the value of the asset that was contributed by the donor, the *income* is the earnings produced by the principal, and *appreciation* (*depreciation*) is the gain (or loss) in the value of the principal since it was contributed. An organization may have several endowed funds, established by one or more donors and for one or more purposes, in its endowment.

*Merriam-Webster's Collegiate Dictionary, 10th Edition*, states that to endow is "to furnish with an income for the continuing support or maintenance of an organization." An endowment, then, is simply a pool of money that is invested to provide ongoing financial resources for the organization's operations or for specific programs. Both state laws and accounting board standards apply to endowments.

## Investment and Spending Rules for Endowments

The Uniform Prudent Management of Institutional Funds Act (UPMIFA) governs endowment spending by charitable corporations and by some trusts. All states except for Pennsylvania have enacted some form of this law since it was approved in 2006. It is written with a minimum of legalese, and development and finance staff members should read it.

In *Building an Endowment: Right from the Start*, Lynda Moerschbaecher says: "In states where a state adopts the model or uniform law, each state has the right to select or reject provisions, to modify those provision or to adopt the law in whole. Therefore, every organization must check its own state law to learn the nonprofit corporate code or UPMIFA rules adopted by that particular state."

Janne G. Gallagher, senior counsel for the Council on Foundations, says:

> In the past, charity managers often believed that they could not rely on outside experts for investment advice and that investments had to be limited to the safest possible vehicles—cash, government bonds and, perhaps, a few blue chip stocks. UPMIFA not only freed charity managers to delegate investment decisions to outside managers, but also allowed them to invest assets for long-term growth, not just current yields. Because UPMIFA lets charity managers invest for growth, not just income, UPMIFA also allows them to take that growth into account in making spending decisions for endowed funds.

The UPMIFA defines an *endowment fund* as "an institutional fund, or any part thereof, not wholly expendable on a current basis under the terms of the donor's gift agreement."

## Types of Endowments

The Financial Accounting Standards Board (FASB) has identified three types of endowments:

1. *True endowment* (also called permanent endowment). The UPMIFA definition of endowment describes true endowment in most states. In these cases, the *donor* has stated that the gift is to be held permanently as an endowment, either for general purposes or for specific programs as identified in a written gift agreement. True endowment is restricted in a written agreement by the donor or is in response to a solicitation that promised to use the gift as an endowment. Under FASB, the portion of the permanent endowment that must be maintained permanently (not used up, expended, or otherwise exhausted) is classified as *permanently restricted net assets*.
2. *Quasi-endowment* (also known as funds functioning as endowment – FFE). Reserve funds, financial windfalls, or unrestricted gifts that the board elects to put into endowment are quasi-endowments. Because a future board could vote to remove part or all the quasi-endowment's principal, it is not a true endowment. A board-designated endowment is classified as *unrestricted net assets*, and its principal may be spent under FASB guidelines. Thus, if the board established an endowed fund, it is quasi-endowment. If the donor makes a gift for an endowed fund, it is true endowment.
3. *Term endowment*. An endowment created for a set period of years or until a future event (such as the death of the donor) is known as a term endowment. After the term runs out or the event takes place, the principal may be expended. The portion of the term endowment that must be maintained for the specific term is classified by the FASB as *temporarily restricted net assets.*

The endowed funds in the organization's endowment must be clearly labeled as one of these three types for accounting purposes. Each of these types may be used for designated or undesignated gifts – for general purposes or to benefit specific projects such as scholarships, professorships, camperships, staff positions, trainings, lecture series, and innovative programs.

## Top 10 Tier 1 and Ivy League Schools with Largest Endowments

The average endowment at a university gained 8.2%. When reviewing the top Tier 1 universities with substantial endowments, over $1 billion the researchers found the following:

| Name | Endowment (Billions) | Tuition Only[a] |
|---|---|---|
| Harvard | 39.2 | 54,000 |
| University of Texas System | 30.0 | 37,580 |
| Yale | 29.4 | 57,700 |
| Stanford | 26.4 | 56,170 |

(continued)

| Name | Endowment (Billions) | Tuition Only[a] |
|---|---|---|
| Princeton | 25.4 | 53,890 |
| MIT | 16.4 | 53,820 |
| Penn | 13.7 | 60,040 |
| Notre Dame | 11.0 | 57,700 |
| Columbia | 10.8 | 64,380 |
| Duke University | 8.5 | 58,700 |
| Northwestern | 8.3 | 58,227 |

The landscape of higher education is changing particularly with the advent of the COVID-19 virus and demands for greater accountability and services from city, state, and federal governments. The young people who are propelling the protests due to the killing of George Floyd are demanding greater responsibility from their universities. They not simply want committees and task forces to be formed. They want a task to appear as a responsibility on a senior administrator's "To Do" list and to see the action become a reality.

Young people are not interested in committees that are formed to run out the clock. They want the task to appear as a strategic goal that has an implementation date a nd, most importantly, is checked-off of someone's "To Do" list.

## The List

Tier 1 and Ivy League schools have a storied reputation for providing full scholarships to deserving students. The research is conclusive: When we reduce barriers to education, we set children up to thrive in all areas of life. The more education a mother has, the more we reduce infant mortality rates. Education leads to healthier childhoods and, ultimately, to greater economic prospects as adults.

Economic returns for higher education graduates are life-changing: College grads see a 17% increase in earnings, compared with a 10% increase for primary and a 7% increase for high school grads.

Colleges and universities continue to struggle with serving low-income and first-generation students. While 60% of the wealthiest students complete their studies and graduate, only about 16% of low-income college students graduate, according to the National Center for Education Statistics (Nov 7, 2017).

America's higher education problem is not a college enrollment problem. The percentage of students who head straight to college after high school has risen from 63% in 2000 to 70% in 2016, *according to the Department of Education*. What we have is a graduation problem, especially among low-income minority students: Just 11% of students from the lowest-income quartile earn bachelor's degrees within 6 years (the commonly used indicator of college success), compared with 58% of students who come from the highest-income group, according to the *Pell Institute*.

The National Center for Education Statistics tracked a 2002 cohort of US students, finding that only 14.6% of those whose families are in the lowest-income quartile earned bachelor's degrees within 10 years, compared with 46% from the highest-income group.

## Legacy Opportunities

Highly selective schools that appear on our list of private schools with the highest valuated endowments provide a legacy advantage. If the prospective student has a parent that graduated from one of the top endowed universities, they have a 65% chance of admission should they apply. What people many times do not want to admit is that top-tier schools give a graduate access to internships, study abroad, graduate fellowships, and opportunities to mingle with elite students and their families. This access can result in the "Tracy Chapman Effect" and change the calculus of a student's life.

Tracy Chapman was a student at Tufts University, a private research institution in Massachusetts. She would sing and play guitar at area coffeehouses on the weekends. One of her classmates had a family member who worked for Elektra Records and brought him to the coffeehouse where she was performing, and she was signed to a contract. Her first album with the

single "Fast Cars" put her on the musical map. Access to a connected college friend led to a successful recoding career.

While Tier 1 and Ivy League schools supply an outstanding academic experience, what is rarely spoken of is the contacts a student makes over time. Because of their historic roots, these universities have graduating classes dating back to the 1700s. One of the most beneficial aspects of the Ivy League, and US universities in general, is the power of the alumni network. The alumni network consists of all graduates from a university. Some may not understand how impactful alumni relations can mean, but it is actually very important, especially when searching for a job post-graduation.

The Tier 1 and Ivy Leagues are renowned for their strong and welcoming alumni networks. After graduating not only are you equipped with a world-class education, but you are also now part of an elite group of graduates. Staying in touch with Ivy League graduates can have a huge impact on your life and the future of your career.

Even before graduating, students can tap into this network for internships that have the potential of turning into future employment opportunities. Attending an Ivy can provide you with the resources and contacts needed to get your foot in the door at world-renowned companies and agencies.

## Harvard University and Brookings Institution: Reports on Education

Dr. Raj Chetty, Professor of Economics at Harvard University, and his colleagues performed a research study on college admission and social mobility. In short, those students who were from lower- or moderate-income families upon graduation considerably increased their social mobility. Access to a school was critical, and the outcome (earnings) in many ways exposed the graduating students to opportunities and networks they would not have had otherwise.

The research also indicated that Tier 1 and Ivy League schools had fewer low-income students attending as opposed to other schools. While these richly endowed schools may have good intentions to accept promising students who need scholarships, thereby increasing their yield of talented students with limited means, there are ancillary costs to attendance. The Millennium Scholars who were interviewed on a segment of *60 Minutes* indicated that while other students were going to New York to eat out and shop, their job was to study and maintain their scholarships.

Going to college without the benefit of a college-going family member to give you pointers, and the knowledge that you will be away from your neighborhood, family, and friends for the first time, can be a daunting experience Attending college with limited resources is also an overwhelming occurrence. It has been the experience of the researchers that promising students with limited means will forego their first choice of their dream college in order to minimize the financial hardship on their families should they be called upon to fill in financial gaps.

Princeton University's FLI is Fly Program (First Generation Low-Income) provides resources, information, and camaraderie for students attending the school. The students have a ready-made family as soon as they step on campus. This group eases their transition to a school that many had only heard about but never visited. This program shows promise for other Tier 1 schools that anticipate accepted more first-generation college students.

### The Realities of Student Debt

According to the Pew Research Center, almost 30% adults under the age of 30 years of age in the United States has student debt. The Federal Reserve Bank of New York reports that more than 30% who are in the repayment phase of their repayment cycles are more than 90 days behind in their payments.

Research performed for the University of Illinois at Chicago (2018) indicated that more than 700 students who matriculated through a pipeline program that wished to recruit more students to schools and careers in medicine, dentistry, and public health indicated that their number one reason for delaying application and admission was financial insecurity and their desire not to assume more debt.

The pandemic and the recent layoffs of professional, semiprofessional, and other nonexempt employees have made matriculation and attendance to college and professional schools a far-off dream unless prospective students can be assured of financial assistance.

Chetty et al. (2017) on the role of education and the link to social mobility reviewed the tax returns and the level of educational attainment in a meta-analysis of US workers. The research of the team indicated that college graduation and income were closely linked. The desire to a higher education and professional school degree is believed to be a ticket for a better life. What students desire is the degree, the better life, and no debt.

An article that ran in the New York Times details the travails of a working-class student and her higher-income classmates who departed college in the Spring 2020 when the coronavirus started to ravage the east coast. The wealthier student left school and moved into her parents' summer home on the coast. The lower-income student returned to Florida to assist her parent with their food truck. While both desired to continue with school, the dream of college completion for the lower-income student may have to be deferred due to her desire to help her parents. The higher-income student was simply waiting for the green light to return to campus.

Much like Westover (2018) describes her ascent to college through serendipity and a scholarship, many students rely on the largesse of the institutions where they matriculate to provide financial assistance to their dreams.

## Conclusion

The continued desire to expand and diversify the US workforce continues despite the pandemic. Many organizations are advertising for new recruits, but the opportunity to enter the workforce and be gainful employed in professional opportunities is being weighed down by the desire to not complete undergraduate or professional school with insurmountable debt.

Benjamin Bernard (2020) reviews various scenarios in an Opinion piece he wrote for Inside Higher Ed. While invading the principal of endowment accounts that exceeds the normal use of interest to pay for scholarships and financial aid at Tier 1 and Ivy League Colleges, the pandemic has changed the way we look at academic resources. There are current students and prospective students who could add to the US economy. If the pandemic is an outlier event, why not assist students who are negatively impacted? During the aftermath of September 11th, there were organizations both nonprofit and profit and foundations both public and private that stepped in to assist. Are university endowment accounts the new September 11th heroes to assist during the pandemic and post-pandemic era? We certainly hope so.

# Accountability

Paolo Ricci
Department of Law, Economy, Management and Quantitative Methods (DEMM), University of Sannio, Benevento, Italy

## Synonyms

Answerability; Liability; Responsibility

## Definition

The term "accountability" implies the duty to act in a responsible way and to be accountable to others for one's actions, in order to maintain effective and logical links between planning, deciding, action, and verification.

The term is complex and chameleonic (Sinclair 1995; Mulgan 2000), and it evokes at the same time: a principle, a duty, a behavior, a system, a process, and a series of operating tools.

The term – particularly familiar in Western societies – comes, in a theoretical sense, from political science studies and should be considered a fundamental cornerstone of democratic systems (Shah 2010; Borowiak 2011).

In any case, it represents the need to convey how financial and nonfinancial resources are used, the correctness of those who operate in a management capacity, the adequacy and conformity of actions taken compared to preexisting objectives, and the results reached over time. This is achieved by highlighting organization policies, laws, and political, social, cultural, and environmental requirements in which the entity – whether public or private – operates, in order to contextualize any evaluation of results and objectives, plans and behavior.

## Introduction

According to the above-mentioned perspective, accountability mostly refers to the ability of putting third parties in a position to evaluate the action taken, so as to adequately make the organization actors responsible for their actions. Financial and nonfinancial communication and all related documents represent costs-reporting instruments laid out by those who manage the organization for those who, even when not directly involved in management tasks, have some interest in it.

It is evident that the type of interest and involvement of a person in the life of a public entity determines the character and modalities of cost-reporting. It is clear that to each different category of recipient should correspond different documents and tailored contents. This helps us understand how, from an accountability perspective, in recent years there has been a significant vertical and horizontal increase in organization information. Social, environmental, gender, and sustainability reports have become widespread in all Western economies.

The information contained in annual reports and other economic documents has been debated in academia for quite some time now: In particular, whether the information is destined to viewers outside of the organization, whether the internal information capacity is always higher than the external, whether different kinds of information – economic, environmental, and social – are alone sufficient to satisfy all expectations and cognitive needs, and whether all interest groups have the same capability of drawing conclusions from the

documents, without any distinction between those that are internal or external to the public entity, involved in the work of the organization or merely potentially interested.

Academia highlighted those who are interested in the life of a company (Freeman 1984) and consequently in the financial and nonfinancial communication of organizations (Bebbington et al. 2014).

In the public sector, because of the specificity of its activities and the use of mostly public money, they are generally identified as follows:

- Governments and public monitoring bodies
- Citizens
- Institutional funders
- Suppliers
- Consumers and their representative groups
- Trade unions
- Freelance employees
- Competitors
- Management

Governments and all remaining parts of the public administration are strongly interested in the communication of financial and nonfinancial data, for fiscal and economic policy reasons and – in some cases – for reasons related to public order and/or to administrative, financial, or hierarchical relationships.

Citizens play a very important role. They can be considered as the main target of organization behavior and therefore the main target of entity information. Citizens can represent, at the same time, at least three categories of subjects: voters, taxpayers, and consumers. As a voter, every citizen has the right to be informed in order to decide by himself in a responsible manner his own behavior, especially during the vote (Brennan 2011; Flinders 2012; Mair 2013). He has the right to receive adequate information but also a duty to actively participate in the life of the community using all his skills, for himself and for others. As a taxpayer, each citizen contributes directly or indirectly, through taxes and fees, to the financing of public sector entities. A complete and transparent financial and nonfinancial information is able to make him understand how his money is used and what services or benefits have been produced with it. In this way, the citizen is enabled to know about the public value created (Moore 1995; Esposito and Ricci 2015). As to the citizen as a consumer or user, please see below.

Those who fund the organization, who depend on annual reports to evaluate how much trust to place in the organization, cannot ignore the elements contained in each accounting document. Banks and other financial institutions can thus get a better idea of the creditworthiness of the public entity involved.

Suppliers could be interested for commercial reasons and for reasons related to market relations. In this case, the economic difficulties of an organization can significantly affect its supply prospects.

In the same way, consumers appear to be more and more involved in the life and decision-making process of an organization. The coproduction of value and the frequent participation of consumers, especially in public service companies, have also led to the establishment of more active communication processes. The value that an informed consumer can bring to the life of a public entity (Ostrom and Ostrom 1977; Voorberg et al. 2015) is undeniable.

Employees and unions are interested in reports and business results because their working lives are linked to the health of their organization and to its plans. Public employees' attention towards organization strategies and reports has grown considerably, while organization solidity and employees' expectations regarding professional and salary growth are greatly linked. Such individuals also display a particularly strong interest in accounting documents, although it is important to say that their interest is proportional to the size of the entity.

Competing organizations are also interested in the economic and financial reports and communication of the entity. Releasing such documents to the public facilitates the access to them and the possibility to examine them closely.

Finally public management figures, who know about the information contained in the reports and the main events affecting the life of the organization in question, have always been interested in communication tools, both as

drafters and as recipients. They represent the top decisional level of the organization and are in the best position to read and perfectly understand such reports. They are aware of the complex reasons – either explicit or implicit – for which they were drafted and of the criteria inspiring them. Therefore, the management forms its decisions on the basis of the information produced by the entity communication system and of the results it releases.

The accounting principles and rules regulating the economic information should guarantee a true and transparent representation of the organization situation and facilitate the evaluation by stakeholders of the work done by administrators, in a framework of responsibility (Roberts 2009).

## The Role of Accountability

The legal and regulatory evolution which has accompanied the public sector reforms in many countries in the past few years, affirming the theories of New Public Management (Pollitt 1993; Hood 1995; Pollitt and Bouckeart 2000) and New Public Financial Management (Olson et al. 2001), has also increased the culture of accountability in public organizations.

We can say that such evolution has allowed us to go from a culture of execution to a culture of results, from accounting to accountability (Bovens 2009). There is in fact a strong connection between accountability and external information. In this sense, it is possible to talk about public accountability, which can be applied to any organization that has a responsibility towards the public. In public administration, the term accountability implies at least three fundamental concepts: (1) the duty on behalf of the public entity to report on the use of public funds and the relative production of results to the citizen, showing correctness and coherence in its administration especially in economic terms, in a thorough and transparent way; (2) the need to introduce mechanisms for taking responsibilities showing that the decisions made are coherent with the tasks taken on and the commitments made; (3) the need to highlight the actual public value being created, showing that the organization operates responsibly to achieve an adequate level of legitimacy and deserved consensus.

In public sector, the role of accountability has a deeper meaning than in private companies. This is because the funds used come from direct and indirect taxes on citizens, and the capital invested is destined to carrying out public functions.

In this sense, accountability means answering to the use of public resources, particularly when the satisfaction of collective needs and social and environmental results are concerned.

Concretely, this requires a multilevel and multitype understanding of accountability (Romzek and Dubnick 1987; Sinclair 1995): political accountability, public accountability, managerial accountability, professional accountability, personal accountability, and more. Political accountability depends on the functioning of democracies and it is developed mainly in the relations between politicians and citizens, elected representatives, and voters. The mandate given by voters and the political acts of those elected, such as laws and regulations, are the basis of this type of accountability. Public accountability is, in some ways, the natural expansion or the most extensive form of political accountability, as it directly involves the individual public entities and citizens. The reporting tools are numerous and very different from each other. When we talk about managerial accountability, the main focus is on the results achieved by an individual manager within the organization for which he works. The elements that characterize its responsibilities are mainly the performance achieved and resources used. Professional accountability concerns, in particular, values and skills that qualify the responsibility of a particular person within the entity. Professional experience, attachment to official duties and especially a sense of belonging are the basis of the expectations that are created in relation to the role that is played. Personal accountability relates exclusively to a person and his or her value system, regardless of the role or experience in previous positions. In this

type of accountability, responsibility is taken for who you are and not for what you do.

Of particular interest are those levels of accountability which are used in public entities to communicate between management and political bodies and between public administration and political parties, movements, and the representative organizations supporting them. Thus, social control over administrative work must find adequate forms of insurance capable of guaranteeing a permanent balance between discretionary power and responsibility.

Accountability is an emancipatory concept through which it is possible to properly develop social relations (Gray and Jenkins 1993), relations which can never depart from the duties arising from the respect of citizens' fundamental rights. In this perspective, accountability is tightly linked to the main ethical and moral choices taken by public managers and politicians. Of course, accountability can be observed from an ethical point of view or, perhaps, a moral one. Despite the risks and the limits that this observation involves (Messner 2009; Cho et al. 2015), there is no denying that accountability can help increase awareness of administrative action, both of those who administer and of citizens. Accountability serves as accelerator of virtuous processes. Increased awareness does not necessarily mean more responsible behavior, but more awareness is essential for the proper development of social relations and, therefore, for social capital (Putnam 2002). It is evident that the following questions remain: what to report, how to report, and when to report, questions around which lurk the elements most critical in public accountability. Due to these moral limitations, accountability cannot be considered as the maximum, or worse, the only expression of the responsibility of a public organization. On the other hand, improving human relations and instilling more conscious behavior can promote the general interests above individual interests. It is important to note that behind every entity, there are specific goals that, in the case of the public sector, have their origins and roots in the constitutional norms, laws, and the legal systems for the protection of both the fundamental rights and freedoms of individuals and of the interests of the entire community.

Correct and true information requires elaboration of accounting principles by the public sector, as well as the definition of rules that are capable of having an impact on the organizational models and governing structures within entities. Transparency of information and the correct representation of results can have a positive effect in public actions, with beneficial effects for all stakeholders. From this perspective, the legal asseveration or auditing of all documents, financial and nonfinancial communication, plays a decisive role, by which accountability is substantiated and is shaped by a qualified and independent professional subject, even more so in the voluntary accounting statements and nonmandatory reports. In fact, trust in the relationship between an administrator and citizens should never be a substitute for proper checks and inspections.

The essential prerequisites of accountability are a clear and unmistakable strategy of the political organs, the identification of accurate and prompt planning guidelines, the clear formulation of the objectives to be achieved, the construction of adequate mechanisms to measure and evaluate events, and finally the creation of effective communication channels, through which it is possible to transfer information and to give concrete personal and collective feedback. In recent years, there has been a wider acceptance of the idea that the legitimation of the public administration in the eyes of the public is less tied to its institutional nature and more and more to its ability to create goods and services in the quantity and with the quality expected by citizens, families, and the market in general (Saves 2000).

This new legitimacy undoubtedly strengthens the role and the function of public accountability, and at the same time the model of governance being adopted, confirming that it cannot be indifferent when achieving an effective management and a transparent relationship between governance and accountability.

These implications have been joined over the years by others – perhaps less visible but certainly

relevant – which reinforced the need for accountability in public administration. In particular, we should mention here the contribution that an accountable behavior of organizations can provide in terms of:

- Improving the relationship between generations
- Reduction of conflicts of interest
- Fighting corruption and cronyism
- Improvement of employee motivation
- Respect for human rights and the environment
- Greater participation and awareness of citizens
- Increase in the quality of the competition

## Conclusion

In light of what has been said so far, it is necessary to go back to some of the considerations made in relation to the definition of accountability or rather to its practical and not only literal definition of its meaning.

The term implies distinctive aspects of the relationship between public administration and stakeholders, or between those who have the responsibility to manage and those who have directly or indirectly helped define the plans and who want to know about the choices made and in some cases criticize the results. In this context, justification plays a decisive role for the public – it is considered a reasonable explanation of the main decisions made, while punishment or reward becomes the immediate and direct consequences of the evaluations formulated by the receivers of information. They should be adequately and sufficiently connected to the results achieved and the expectations developed.

Specifically, the following factors define the level of accountability of any organization:

- A clear and articulated planning process
- A transparent definition of the internal and external responsibilities
- An adequate accounting system
- An effective internal system of monitoring and evaluation
- Periodic communication of the activities carried out
- A significant benchmarking activity
- A significant use of technology in the communication process

A strong presence of these factors improves the quality of the evaluation process, which in turn leads to more transparent, understandable, and effective forms of cost-reporting.

## Introduction

The past four decades or so have witnessed enormous efforts to modernize the public sector worldwide under the banner of New Public Management (NPM). A bewildering diversity of meanings regarding NPM and its effects has been expressed over time, including the viewing of it as a comprehensive package of ideas (Hood 1991), a label for the clusters of reforms, variations on a theme (Hood 1995), the leading tool box for healing all the managerial wounds, or "the cruellest invention of the human spirit" (Lapsley 2009). Despite the often spotty and sometimes even detrimental results (Hood and Dixon 2016; Hyndman and Lapsley 2016), today NPM has circled the earth by diverse paths, landed in various settings, and become entrenched in both theory and practice around the world.

One of the main pillars and fundamental tenets of NPM-driven reforms was a growing preoccupation with the notion of accountability. Indeed, numerous and repeated calls were voiced loudly by governments almost everywhere to make public sector managers more accountable for results, instead of granting them more power and autonomy. In the aftermath of these calls, the search for forms of accountability, concerned with effectiveness, efficiency, and the overall performance of public sector organizations, was initiated. The Russian state was not immune to this global trend. At the outset of the new millennium, appeals to boost efficiency, effectiveness, and accountability began to be widely echoed in the country, serving as the truths, in whose name the Russian public sector was to be revitalized. In this context, the need for reinvention of the post-Soviet model of the state was widely acknowledged, and a large-scale reform package was promoted by the federal government. This encapsulated, among other things, an updated version of accounting and financial reporting to be practiced within the Russian public sector.

This chapter seeks to elucidate the role(s) that the notion of accountability has played in the reconstruction of Russian central (federal) government accounting. Special emphasis is placed on linking the central government reform

initiatives aimed at bringing greater (and novel forms of) accountability within the Russian public sector with those endeavors to implement them in one state-sponsored university of Russian tertiary education (hereafter, the university or educational establishment). Notably, it is beyond the scope of this chapter to reach a verdict on whether the findings are applicable to other settings, implying that the generalizability of results to other Russian public sector organizations (including universities and other higher educational establishments) and/or levels of government may be quite problematic.

The remainder of this chapter proceeds as follows. Considering the importance of accountability and providing that it is still (relatively) ill defined, this chapter first aims at shedding some light on the ongoing debate of what accountability is and what the relationship between accountability and accounting represents. It then introduces some thoughts and reflections on public sector accountability. Furthermore, the interplay between accountability and accounting within the wider context of the Russian public sector reforms is described, using the evidence obtained from the university. In doing so, two levels are clearly differentiated in this chapter, incorporating the initiatives of the federal government (i.e., the macro-level) with efforts made to implement them locally (i.e., the micro-level). Finally, some concluding remarks are offered.

## Toward Defining Accountability

Accountability is always good; no one can deny this. However, it is hard to imagine an organization that is branded "too accountable" (Koppell 2005). While there is a wealth of literature on this topic, there is a clear-cut consensus that accountability is still an inherently "contentious," "complex," "heterogeneous," "contradictory and indeed contrary," ill-defined, and poorly structured concept (Almqvist et al. 2013; Sinclair 1995; Kearns 1994; Roberts 1991; Mulgan 2000). Sinclair (1995, p. 219) refers to the "chameleon of accountability," which is a "cherished concept, sought after but elusive." Nevertheless, the author continues that "Accountability is multiple and fragmented: being accountable in one form often requires compromises of other sorts of accountability" (Sinclair 1995, p. 231). Likewise, Kearns (1994) claims that "It is laden with competing assumptions and complicated by contextual factors that make the notion of accountability the ultimate 'moving target'" (p. 187).

The lack of clarity and coherence regarding the meaning of accountability is particularly striking in the extant literature. On the one hand, a wide array of closely related and often-overlapping terms abounds. This includes, but is not circumscribed by, *responsibility*, *responsiveness*, *answerability*, *blameworthiness*, and *transparency*. Although holding various conceptual implications, they are sometimes used interchangeably. On the other hand, accountability connotes *bureaucratic control* and *enforcement* in some articles, *democracy* and *integrity* in others, while still other commentators treat *accountable* as synonymous with *law-abiding*. It is evident that the meanings above are often not consistent with one another, implying that organizations cannot be accountable in all the senses implied by this single word.

The concept of accountability has gained increasing popularity recently. Not surprisingly, a search for the word "accountability" in Google resulted in over 319,000,000 entries, evincing a stupendous interest in the topic! Responding to this growing interest in accountability, a significant amount of research of a multidisciplinary nature has emerged in the literature. This embraces such fields as public administration, political science, accounting, ethics, and governance. In that regard, it is noteworthy that some peer-reviewed international journals incorporate the word "accountability" in their titles. Among those are *Accountability in Research*; *Financial Accountability and Management*; *Accounting, Auditing and Accountability Journal*; *Social and Environmental Accountability Journal*; *Journal of Leadership, Accountability and Ethics*; and *Educational Assessment, Evaluation and Accountability*.

The traditional view of accountability is that of a relationship involving "the giving and

demanding of reasons for conduct" (Roberts and Scapens 1985, p. 447). In this broad sense, accountability can be seen as "a chronic feature of daily conduct" (Giddens 1979, p. 57). At the very heart of this relationship is stewardship. If one is accountable, then one is answerable to another party and bound to render an account for actions taken, decisions made, and assignments completed, in either in written form or verbal communication (Ijiri 1975; Robinson 2003; Roberts and Scapens 1985). Specifically, the former, who is obliged to render the account for actions taken, is known as the *steward, agent,* or *accountor*, while one entrusting power and authority and to whom the account is presented is *the principal* or *accountee*.

Furthermore, the accountability relationship normally requires the accountor (agent) to account for his [her] activities assigned by the accountee (principal) and their consequences for the benefit of the latter (Ijiri 1975). Therefore, an *accountant* joins this accountability relationship between the accountor and the accountee, as a third party. More specifically, the accountant enters into this relationship with the primary goal of assisting the accountor in accounting for his [her] activities and their consequences and, at the same time, providing information to the accountee. This is to say that accounting operates in a principal–agent relationship (Mellemvik et al. 1988; Gårseth-Nesbakk and Timoshenko 2014) and that the accountant is involved in a dual relationship – one with the accountor and another with the accountee (Ijiri 1975). The same can be said for an *auditor*, whose main task is to provide "professional expertise and judgment" to both the accountee and the accountor, for the purpose of determining whether accounting activities performed by the accountant satisfy required practice.

One of the elements of accountability is control of the organizational activities. As indicated above, this is what has become known in the literature as the control objective of accounting (see e.g., Mellemvik et al. 1988; Gårseth-Nesbakk and Timoshenko 2014). The *UN Manual on Government Accounting* accentuates the role of accounting systems in ensuring that applicable laws and regulations are followed; that financial records and statements provide a "true and fair" result of operations; that the accounts and reports are issued and disseminated in time; and that expenditures are within approved ceilings (The UN 2000). This is coined *fiscal accountability.*

All the above suggests that the central task of accounting is to accomplish accountability. Viewed in this way, the latter can be seen as the social and organizational backbone of accounting. As the seminal contributor on this topic, Ijiri (1975) points out that accounting:

> "... is a system designed to facilitate the smooth functioning of accountability relationships among interested parties";
>
> "... starts with the recording and reporting of activities and their consequences, and ends with the discharging of accountability." (p. 32)

In their examination of the relationship between accounting systems and systems of accountability, Roberts and Scapens (1985) stress the role of the former in providing strict temporal order for an organization. Accounting systems are said to divide organizational life into accounting periods and contribute to generating regular reports. What is more, accounting involves the establishment of the most important boundaries of an organization – those internal and external boundaries that are determined by the system of accountability. The latter corresponds to the concept of an accounting entity, according to which, "Accounting is possible only when there is an area of economic interest that can be defined." Thus far, accountability provides for the "binding" of organizational time and space (Roberts and Scapens 1985, p. 448).

With the passage of time, however, the scope of accountability has been considerably enlarged to incorporate novel and more complex relationships. This renewed viewing of accountability goes well beyond its core sense of being called to account for one's actions. Munro and Mouritsen (1996) suggest that accountability should be comprehended as a broad concept, one that transcends a formal order to encompass a complex system of reciprocal rights and obligations that abound in organizations. Roberts (1991) emphasizes the latter and argues that

accountability also involves heterogeneous social practices, by means of which we tend to remind each other about our reciprocal dependence. Such reciprocal dependence can be thought of in both instrumental and moral terms; we are bound up with each other not simply in narrow, calculable ways but also, more broadly, in intended and unintended ways. That is why Roberts (1991) divides the concept of accountability into individualizing and socializing forms. In turn, Lindkvist and Llewellyn (2003) propose using the terms *accountability* and *responsibility* to connote instrumentality and morality, respectively.

As a matter of fact, it is the individualizing form of accountability which tends to dominate the mainstream body of research. Linked to formal organizational structures, it generates "…a sense of the self as essentially solitary and singular, nervously preoccupied with how one is seen" (Roberts 1991, p. 355). However, in a more constructive vein, Roberts identifies a socializing form of accountability that may counteract these negative consequences. While still behind the curve, a growing interest in investigating this form of accountability or responsibility, as Lindkvist and Llewellyn (2003) name it, has been documented recently. All in all, whereas the individualizing form of accountability relates to the system world where the instrumental logic of work prevails (e.g., accounting practices), the socializing form of accountability or responsibility portrays the life world characterized by non-instrumental interaction.

Accountability is, thus, not only a formal order but also a moral order, a system of reciprocal rights and obligations (Roberts and Scapens 1985). Indeed, rather than demonizing the formal accounting system as the decisive force in achieving organizational control, the interplay between a variety of formal and informal mechanisms is currently recognized (Lindkvist and Llewellyn 2003). The practice of accounting institutionalizes the notion of accountability and the right of some people to hold others to account for their actions (Roberts and Scapens 1985, p. 448). In fact, this also means that the absence of accounting results in the absence of accountability.

## Some Thoughts and Reflections on Public Sector Accountability

Accountability in the public sector has been given extensive literature coverage (Mulgan 2000). Even though there is a clear-cut agreement that accountability in the public sector is a prerequisite, there is a tiny consensus on which mechanisms should prevail at any point in time. This has resulted in "a complicated web of multiple, overlapping accountability relationships," within which public officials must operate (Romzek 1998, p. 197). The search for ways to keep public officials accountable has led scholars to identify various types of accountability, and a great deal of research effort on the topic is vividly indicative of that (Sinclair 1995; Romzek and Dubnik 1987; Kearns 1994; Bovens 2009). Although the professional and scholarly community may never reach agreement on one definition of accountability, it is deemed beneficial to elaborate an analytical framework that acknowledges the viability and contextual relevance of several definitions, as a guide for formulating strategies and policies in this arena (Kearns 1994, p. 187). It is pertinent to note here that the discussion below does not aim to provide all of the definitions that exist but, rather, those definitions that are the most illustrative.

To begin with, public sector accountability may exist at various levels, given a spectrum of stakeholders. According to Chan (2003), a distinction can be made between the three levels of accountability. The first level is *internal* accountability within the executive branch, where lower-level officials (i.e., bureaucrats) are accountable to their superiors (i.e., the elected members of the government). The second and higher level is *internal* accountability of the executive branch to the legislature. This kind of accountability is based on the proposition that elected officials occupying seats in the legislature are more directly accountable to the people than are appointed officials in administrative positions. The third and highest level of accountability is *external* accountability of the legislature to the electorate and general public. This fact is pointed out by, e.g., McCormick and Tollison (1981, p. 24): "In a

representative democracy voters-taxpayers can be considered as analogous to owners (principals) and politicians as analogous to managers (agents)", or, in the words of Sterk (1988, p. 659): "Legislators are agents. They act on behalf of people they represent, not for themselves as individuals."

Next, Barbara Romzek and her associates (Romzek and Dubnik 1987; Romzek 1998; Romzek and Ingraham 2000) characterize accountability relationships that "reflect both internal and external control strategies and vary in the degree of autonomy they afford the accountable manager" (Romzek and Ingraham 2000, p. 242). This typology for public sector accountability, believed to be among the most influential, was applied, in particular, to investigate events leading up to the explosion of the Challenger space shuttle in 1986. In essence, this approach yields four accountability types – hierarchical, legal, professional, and political – each of which is associated with a different "value emphasis" (see Table 1). Remarkably, this set of accountability types goes well beyond the purely financial dimension.

*Hierarchical* accountability is based on close supervision of individuals who possess low work autonomy. *Legal* accountability entails detailed external oversight of performance, for compliance with established mandates which managers are obliged to fulfill. *Professional* accountability is based on deference to the expertise of one's peers or work group. Finally, *political* accountability is established by responsiveness to the concerns of key external stakeholders. The diverse values and behavioral expectations pertinent to each accountability type are shown in Table 2.

**Accountability and Accounting: Insights from Russian Public Sector Reform, Table 1** Various types of accountability relationships (Adopted from Romzek and Ingraham (2000, p. 242))

| | | Sources of expectations and/or control | |
|---|---|---|---|
| | | Internal | External |
| **Degree of autonomy** | **Low** | Hierarchical | Legal |
| | **High** | Professional | Political |

As the literature demonstrates, public sector managers tend to "work under one or two of these types on a daily basis with the remaining types being in place but underutilized, if not dormant" (Romzek and Ingraham 2000, p. 242). In addition, there is often a shift in focus, meaning, and priority among heterogeneous types of accountability in times of change (Romzek 1998). To illustrate, in his study of the reform of the Italian public sector, Panozzo (2000) points out that managerial accountability has become transformed into a matter of legal compliance – management by decree – rather than a mechanism for promoting change. In a similar vein, Kurunmäki (1999) has documented a narrowing of the basis of accountability resulting from Finnish health care reforms, which led to a conflict with the broader societal conceptions of accountability held by medical professionals.

All the above fits squarely with a widely cited empirical study of accountability by Sinclair (1995). The author explores the way chief executives in the Australian public sector perceive and practice their accountability and unveils five types of accountability – political, public, managerial, professional, and personal. For public sector managers, political, parliamentary, or "upward" accountability is expressed in the desire to be loyal to one's political party. The duty to serve clients and the public constitutes public or "outward" accountability. In the aftermath of NPM efforts and assiduous attempts to reinvent the public sector around the globe, more recent theorizing has given much more prominence to managerial or financial accountability (Panozzo 2000). The latter embodies the concepts of managerial autonomy, efficiency [the rational use of resources in the process of achieving objectives], and effectiveness [the achievement of programmed objectives]. It is reinforced by the very impetus for quantification, that is, specification of measurable results (i.e., outcomes), performance or objectives by managers and their superiors, accompanied by a relaxation of formalized controls over inputs and processes (Sinclair 1995). Finally, professional and personal accountabilities to one's profession and one's code of ethics are also indispensable components in Sinclair's

**Accountability and Accounting: Insights from Russian Public Sector Reform, Table 2** Values and behavioral expectations of diverse accountability types (Adopted from Romzek and Ingraham (2000, p. 242))

| Type of accountability | Value emphasis | Behavioral expectations |
|---|---|---|
| Hierarchical | Efficiency | Obedience to organizational directives |
| Legal | Rule of law | Compliance with external mandates |
| Professional | Expertise | Deference to individual judgment and expertise |
| Political | Responsiveness | Responsive to key external stakeholders |

typology. Sinclair's findings provide strong evidence indicating that the aforementioned types of accountability are not mutually exclusive but contextually dependent. This means that organizations may be accountable in more than one way.

## Accountability and Accounting in the Light of Russian Public Sector Reform: A Macro-Micro Link

### The First Wave of Public Sector Reforms in Post-Soviet Russia

The dominant accountability pattern established within the Russian public sector during the 1990s was exclusively concerned with the budgetary process. In this context, the annual federal budget was reckoned to be the major tool for demonstrating, enforcing, and discharging internal accountability between the Federal Assembly (the national legislature of the Russian Federation) as the principal and the Russian Cabinet of Ministers (the Government, the national executive body of the Russian Federation) as the agent. Not surprisingly, this clear-cut emphasis on the budget gave birth to a system of budgetary (or Treasury) accounting, capable of measuring and communicating actual budgetary performance versus authorizations. The report on the federal budget execution was the main and solely accounting statement to be submitted to the Russian legislature. Indeed, the setting was characterized by the sudden disappearance of Soviet methods of control over budget execution through the banking system. This eventually prompted novel ways of doing accounting in the Russian public sector. The Treasury accounting and financial reporting system, in fact, filled this void (Timoshenko and Adhikari 2009a).

While there was a growing preoccupation with the government's overall management of the macro-economy at the federal level via the budget, Russian public sector entities were forced to comply entirely with preestablished rules for budget limits and expenditures implanted by their overseeing government agencies. This laid down the foundation for a system of accounting for budget institutions. As the evidence gained from the university demonstrated (Timoshenko 2008; Timoshenko and Adhikari 2009b), the educational establishment was compelled to report to its main supervisory body in Moscow and the regional treasury department on the use of all its funds, from both budget and off-budget sources. Any failure, delay, or mistake in so doing could lead to sanctions imposed by government officials. Interestingly enough, other users of financial statements apart from the state were simply not emphasized.

This resulted in a strong one-way relationship between the state as the principal and the university as the agent, making subordinate accountability to the Ministry/Agency the prevalent pattern for the university. Thus far, the system of government accounting and financial reporting established during the 1990s was designated to facilitate the smooth functioning of this accountability type. In this context, the dominant tenet of accounting was control and legal compliance, directed at ensuring that the needs of the state were implanted into the university accounting system and that the recognition of its requirements was assured; that applicable Russian laws and regulations were followed; and that the accounts and reports were issued and disseminated in time. For example, funds allocated to the educational establishment for scholarships had to be utilized for that purpose and not for another! Otherwise,

sanctions might be imposed, up to the halting of state financing. The same scenario might occur, given the university's failure to submit its reports in time. What occurred was a detailed rule for almost every conceivable transaction, intended to prevent spending in excess of appropriations and to secure the collection of revenues as specified in the budget. In a nutshell, accounting was seen as a mere exercise, leaving the university accounting department with no involvement other than following rules set in Moscow.

## Reform Efforts Toward NPM in Russia: Reality or Rhetoric?

The turn of the new millennium witnessed the meteoric rise of public sector reforms in Russia under the umbrella of NPM. In this context, a variety of ambitious, large-scale top-down government initiatives came to the fore, heralding a discernible shift in the ideology imbuing Russian public administration. Among the key items on the menu from the NPM "cuisine" in Russia were the structural reform of government agencies and other reforms of all federal relations and self-government, the launch and implementation of performance-oriented budgeting and medium-term financial planning, as well as a stride away from traditional cash accounting toward more informative business-like accrual accounting (Timoshenko and Adhikari 2009a). Indeed, rather than being a matter of legal compliance with the state's requirements in the course of budget execution, there was a growing preoccupation at the macro-level with running public sector entities in a more effective and efficient way.

In this context, the federal government appears to have commenced the modernization process itself by essentially reorganizing its executive branch. The updated structure of the Russian Cabinet of Ministers was vigorously supportive of this, containing a clearer accountability framework in relation to its previous pattern. For example, the Federal Ministry for Education and Science was restructured into two federal agencies and two federal services under its supervision in attempts to discern the formulation of state educational (and research) policy from its provision. This underlined the emphasis of Russian reforms on heightened accountability *within* the executive branch, so that, rather than being held accountable for the correct use of inputs, ministries/agencies/services could be held accountable for the results of using those inputs. Therefore, enhancing managerial accountability became a top priority at the macro-level.

With a clear-cut appeal for a shift from a culture of execution to a culture of results at the macro-level, the situation varied markedly at the micro-level. As the evidence obtained from the educational establishment indicated (Timoshenko 2008; Timoshenko and Adhikari 2009b), several accountability forms acted in conjunction with one another on a daily basis there. Remarkably, with the university as an entity formally accountable to the state in legal terms, some teachers and researchers saw themselves as more responsible to their clients, rather than to the university employing them. Among those clients were free-from-charge and fee-paying students, academies, parents, industrial firms, and potential employees. Having said this, there was an obvious need to be responsive to the concerns of varied contractors who had a legal, moral, or ownership-type right to know how the university spent its money and what results were achieved. All this, without any doubt, denoted the existence of the socializing (that is, professional, political, and personal) forms of accountability within the educational establishment.

Notwithstanding the fact that the university became responsive to the concerns of its clients, hierarchical administrative accountability to the ministry/agency remained the potent type of accountability for the educational establishment. Indeed, even though a constellation of actors had a stake in university affairs, the federal officials in Moscow played the most decisive roles in university affairs. Notably, the university's accounting statements continued to be treated as confidential documents and not transparent to the general public, even though the university charter required this. In fact, only those university administrators with budget responsibility were permitted to access information within the auspices of their authority. Rather than being intentional, this probably represented an entrenched habit inherited from the Soviet past, when all financial statements had been

regarded as confidential documents. It should be noted, however, that the situation has altered dramatically since the early 2010s, when Internet users were given access to plentiful data regarding all public sector organizations throughout the country, including their financial statements.

Thus far, the federal government continued to dictate the way accounting was to be practiced at the university. Under these circumstances, the university was coerced by the federal authorities to alter its accounting and financial reporting system from cash to accruals, irrespective of its wants and wishes. Widely touted by the Federal Ministry of Finance's officials, a new myth of accrual accounting was dispatched to the university as either a suitable replacement for or a possible complement to the myth of cash. Just as cash accounting was a deeply entrenched way of accounting for public monies at the educational establishment, over many years, accrual accounting was meant to supersede or complement the former.

However, the empirical evidence gathered from the university suggests that an up-to-date version of accounting and financial reporting calibrated at the macro-level did not significantly encroach upon the existing budgetary practices locally. It is therefore not surprising that cash-basis data was still extensively used and indeed constituted the sole source of information in the day-to-day management of university operations (e.g., the payments from fee-paying students) and in the budgetary process. As such, the launched accrual-based financial statements were merely seen as an additional burden for the university accounting department. All this leads one to conclude that changes at the central government level penetrated down to the university in form – and much less in practice. Most likely, the introduction of a novel version of accounting by the Russian state was regarded as more of *a symbol of legitimacy* for the university rather than of an actual financial management tool.

## Concluding Remarks

The following conclusions are worth mentioning here. Firstly, an inextricable relationship does exist between accountability and accounting. Albeit more in rhetoric than practice, appeals for a more accountable Russian public sector gave birth to a new, more informative accrual-based accounting system. This is to say that the practice of accounting institutionalizes the notion of accountability (Roberts and Scapens 1985), implying that any shift in focus and priority among the diverse patterns of accountability leads to important repercussions for the accounting system. Consequently, when researching (public sector) accounting, a special reference to accountability is a prerequisite.

Secondly, the very meaning of accountability underwent a complete and dramatic change in the aftermath of the Russian public sector reform. More specifically, calls for greater and novel forms of accountability triggered by NPM-style reforms worldwide can help comprehend the Russian public sector accounting change in the following manner. On the one hand, at the macro-level, the rise of a concern regarding accountability can be seen as linked to the rise in efficiency and effectiveness as a key part of the strategy to revitalize Russia's public sector. On the other hand, at the micro-level, a concern with accountability may be characterized as an imposition of new accounting techniques and practices by the federal government in attempts to regulate the university in the very name of augmented efficiency and effectiveness. The latter argument aligns with Schedler's (1999) view of accountability as enforcement, or "the capacity of … agencies to impose sanctions on power holders who have violated their public duties" (p. 14). All this is to say that accountability is indeed context-specific.

Finally, while NPM (now no longer new) was the dominant doctrine of administrative reform and the leading toolbox for healing all the managerial wounds throughout the 1990s and in the early twenty-first century, the 2010s are far from the best of times for NPM. In that regard, questions remain unanswered as to whether NPM actually led to better accountability in the public sector worldwide. With the relevance of NPM steadily on the wane and its potential exhausted, and with some academic commentators even presaging its ultimate demise, public administration is clearly

undergoing a paradigmatic shift toward brand-new [post-NPM] avenues of thought (Klijn 2012; Christensen and Lægreid 2011; Osborne 2006; O'Flynn 2007; Almqvist et al. 2013). So, more than likely, four decades of the ideological hegemony of NPM in the global public sector arena seem to be history now, giving birth to what is generally referred to in the contemporary literature as New Public Governance. Having increasingly come into vogue, this emerging conceptual framework pledges to eradicate the debilitating effects that the managerialism of recent decades caused. This may result in updated (perhaps, more horizontal) accountability types and changes in the way accounting is (to be) practiced.

## Synonyms

*Corruption*

Blackmail; Bribery; Coercion; Crime; Crookedness; Degeneracy; Dishonesty; Exploitation; Exploitation; Fraud; Immorality; Immorality; Impurity; Jobbery; Malfeasance; Misrepresentation; Moral; Nepotism; Profiteering; Racket; Shuffle; Trust; Unscrupulousness; Venality

*Accountability*

Answerability; Liability; Obligation; Reporting; Responsibility; Transparency

## Definition

The most widely accepted definition of corruption is that provided by Transparency International (https://www.transparency.org/). According to this prestigious institution, corruption can be defined as "the abuse of power for private gain." Recent years have seen a consensus in classifying corruption as grand, petty, and political, depending on the amount of money lost and the sector in which this occurs.

Grand corruption is the realization of acts at high levels of government which distort the policies or functioning of public administrations, in a manner that some benefit at the expense of public goods or services and thus cause serious harm to individuals in particular and society as a whole. It often goes unpunished.

Petty corruption refers to the daily abuse of power held by civil servants of low and medium standing in their dealings with citizens, who frequently try to access basic goods and services in places like hospitals, schools, police departments, and other agencies.

Political corruption derives from the manipulation of policies, institutions, and procedural rules in assignation of resources and the financing of these by members of government staff, who abuse their position to sustain their power, status, and wealth.

Accountability refers to that individuals, agencies, and organizations (public, private, and civil society) held responsible for reporting their activities and executing their powers properly. It also includes the responsibility for money or other entrusted property.

## Introduction

Perhaps the first example of corruption in the civilized world is recorded in low Mesopotamia,

Sumeria, where an essay on the lives of students relates that one of them, on returning home, informs his father that he had been beaten by the teacher (a common practice at the time) for being absent, late, and for his poor writing, and so the parents invited the teacher round for lunch:

> When the teacher arrived, he was placed in a position of honour, he was offered wine and, as a gift, they dressed him in new robes and placed a gold ring on his finger. The grateful teacher turned to the student and said: Since you have not scorned my words... I wish you much success ... You have fulfilled your scholarly duties well and have become a man of good. (Abreu 2005)

For other writers, the first recorded act of corruption occurred in Ancient Egypt during the reign of Ramses IX (1142–1123 BC) since a papyrus relates the difficulties experienced by one of the Pharaoh's officials because he had reported the dirty dealings of a fellow official who had been in association with tomb robbers and had turned a blind eye to the loot taken from tombs in exchange for substantial payments.

Corruption remains one of the biggest challenges to all societies, including European ones. Although the nature and scope of the corruption may vary from one country to another, it has been proved that in all cases it is harmful as investments are reduced, so causing hindrances to the internal market and a drop in public income. It has, for example, been calculated that the economic costs arising from corruption in the European Union (EU) countries amount to 120 million euro a year (1% of the GNP) (European Commission 2011a).

According to the successive Eurobarometers on corruption produced every 2 years since 2009, 3 out of 4 interviewees on average consider corruption to be a very serious problem. Worse still, a study titled "Bribe Payers Index Report 2011" and carried out by Transparency International (Hardoon and Heinrich 2011) reports that 5% of EU citizens admit to having paid one bribe a year.

So far this century, there have been important efforts, although insufficient, internationally, in Europe and domestically, to bring down corruption (European Parliament 2003). In the EU, a legal framework has been developed to fight corruption by the adoption of legislation against corruption in the private sector (Council of the European Union 2003, p. 54) and the EU adhesion to the United Nations Convention against Corruption (UNCAC) (Council Decision 2008/801/EC (OJ L 287, 29.10.2008, p. 1)).

Furthermore, the Treaty on the Functioning of the European Union recognizes that corruption is a serious offense with a transborder character against which the member states cannot fight using only their own means. Article 83(1) of the Treaty on the Functioning of the European Union lists corruption among those crimes for which directives providing minimum rules on definition of criminal offenses and sanctions may be established, since corruption often has implications across, and beyond, internal EU borders (European Union 2012). Bribery across borders, but also other forms of corruption, such as corruption in the judiciary, may affect competition and investment flows. It has been agreed that anticorruption measures should constitute an important part of EU policies.

It should be remembered that at the international level, the main existing monitoring and evaluation mechanisms are the Council of Europe Group of States against Corruption (GRECO), the OECD Working Group on Bribery, and the review mechanism of the UNCAC.

In an attempt to foster political will to combat corruption and improve anticorruption policies and measures adopted by the member states, the European Commission created a new mechanism, the *EU Anti-Corruption Report*, to oversee and evaluate anticorruption efforts. With the support of a group of experts and a network of research correspondents and an appropriate EU budget, the report is prepared by the Commission and is published every 2 years, as of 2013. These reports seek to reflect the achievements, the vulnerabilities, and the commitments of all the member states. They also identify trends and weaknesses and encourage learning and the sharing of best practices. Along with this tool, it was also agreed that the EU was to participate in the GRECO (Report from the Commission to the Council on the modalities of EU participation in the GRECO; COM(2011) 307).

The first *EU Anti-Corruption Report* (European Commission 2014) covers all 28 EU member states and focuses on selected key issues of particular relevance to each member state. It describes good practices as well as weaknesses and identifies steps which will allow member states to address corruption more effectively.

In what follows, and according to the abovementioned Anti-Corruption Report, the most important areas in the European scenario in which corruption appears are identified and, also, the measures that can be adopted to fight it.

## Specific Risk Areas

### Selected Vulnerable Sectors

In several European member states, there are sectors which are particularly vulnerable to corruption and which require specific answers:

- Urban development, building, and environment planning. Given the importance of this sector in many countries (Spain is probably the clearest example), Benito et al. (2015) have done a list of the most frequent corrupt practices:
- Classification of non-developable plots as developable plots in areas which, due to their natural features, should remain non-developable.
- Illegal building up of non-developable land, either with municipal approval or taking advantage of the municipality's negligent inactivity in controlling urban illegalities.
- Classification as urban developable of land that should not be classified by law.
- Partial modification of the municipal urban plan instead of a general revision of the plan, which would be more appropriate. These partial modifications distort the general urban plan of the municipality.
- Illegal urban activities are legalized through ad hoc plan modifications, preventing the judicial sentence from being executed.
- Urban plans or urban plan modifications are approved without meeting urban law requirements.
- Urban developments are executed circumventing some basic legal requirements.
- Municipal land disposal revenues, which should be reinvested in municipal land, sometimes finance municipal current expenditures.
- Municipal land not used for the required legal purposes.
- Urban plans ignore environmental legislation, which causes ecological damages.
- Healthcare; in particular regarding under the counter payments and corruption in public contracting within the pharmaceutical sector.
- Corruption in tax administration.

### Integrity and Transparency of the Financial Sector

A report, titled "Promoting an Appropriate Policy on Tax Havens," from the Parliamentary Assembly of the Council of Europe (2012) concludes that there are connections between large cases of corruption and tax evasion through offshore companies and tax havens. The report refers to the Stolen Asset Recovery Initiative of the World Bank (this initiative can be seen at http://star.worldbank.org/star/) and the UNODC, which analyzes 150 grand corruption cases and finds a direct link between large-scale corruption by high-level public officials and the concealment of stolen assets through opaque shell companies, foundations, and trusts. Furthermore, it indicates obstacles to investigating and tracing stolen assets due to lack of access to information on beneficial ownership and the use of sophisticated multi-jurisdictional corporate structures.

Other examples of bad banking practices that may be linked to corruption include fixing interest rates in favor of certain persons; loans linked to irresponsible, speculative operations; and failing to exercise due diligence.

### Corruption at the Regional and Local Level

Corruption is most rife at regional and local government levels given that internal controls tend to be laxer than at central government level. In many of the member states, the wide discretionary powers of regional governments and local administrations (which also manage considerable resources)

are not accompanied by suitable responsibility and control mechanisms. In these cases, it is necessary to redouble the efforts to instill the good practices in operation in other regions and local administrations, especially in terms of regulations regarding transparency, disclosure of assets, prevention and sanctioning of conflicts of interests, and public spending. As an example, Italia has created a network of over 200 regional, municipal, and provincial administrations with the aim of jointly preventing corruption and mafia infiltration in public systems (http://www.avvisopubblico.it/).

### Foreign Bribery

Recent years have witnessed a large number of corruption cases linked to companies' overseas behavior, especially in countries where corrupt practices are widespread.

### State-Owned Companies

Some EU member states suffer from deficiencies in the supervision of state-owned companies, with blurred legislation and politicization that prevents appointments that are merit based or that are in the general interest. There is little transparency regarding the allocation of funds and, in some cases, the purchase of services by these companies. Recent investigations into alleged misuse of funds, corrupt practices, and money laundering linked to state-owned companies point to the high level of corruption-related risks in this area, as well as to the weakness of control and prevention.

### Petty Corruption

Petty corruption is present in just a few of the EU member states (with Romania possibly the most outstanding case), and the most prominent examples are unofficial or non-authorized payments that are still made to secure favorable treatment, especially within the health system.

### Links Between Corruption and Organized Crime

The links between organized crime, companies, and politics remain an important concern in many countries, in particular at the regional and local level and especially in public contracting, construction, maintenance, and waste management services.

## Control Mechanisms and Prevention

### Prioritizing Anticorruption Policies

It is vital that anticorruption policies figure high on the list of governments' agendas. The financial crisis that has been dragging on for many years now has brought to the fore the problems of integrity and accountability among decision-makers. Most of the countries facing serious economic difficulties have recognized the severity of their corruption-related problems and have brought in, or are in the process of bringing, anticorruption programs to counter the risks of embezzlement of public funds.

### Political Accountability

The crisis has led to social protests against not only social and economic policies but also the integrity and accountability of the political elite. Scandals involving corruption, embezzlement, and unethical behavior of politicians have stirred up discontent and distrust of the public system.

Political integrity is a serious problem in many countries. Codes of conduct within political parties or elected parliaments at central and local levels seem to be the exception rather than the rule. Even when these do exist, they frequently have no effective supervision mechanisms or any clear, transparent rules regarding the sanctioning of breaches. In some cases, insufficient accountability has led to a perception that the political elite are above and beyond the law. The politicization of contracting public administration posts at all levels has only served to breed more corruption, the risk of conflict of interests, and weakened control mechanisms, all of which belittle the overall credibility of public administration as a whole.

In this respect, an active legislature plays an important role in governance and accountability, which in turn is essential for democracy. The primary roles of legislatures are legislation,

oversight, and representation. Oversight refers to controlling the activities of the executive and – on behalf of citizens – holding the executive accountable. Therefore, legislative oversight can contribute to ensuring that the relationship between the state and its citizens is characterized by accountability (Hudson and Wren 2007). In fact, legislatures play a key role that makes them pivotal to good governance, since they are involved both in vertical and horizontal accountability mechanisms. In other words, legislatures are the point in a governance system where voter-executive relations (vertical accountability) come into contact with legislature-executive relations (horizontal accountability). It is through playing this pivotal role that legislatures can contribute to effective and democratic governance. By providing oversight, they can contribute to accountability, which in turn can facilitate learning and improved performance (Hudson and Wren 2007). In democratic countries, ultimate accountability of the executive is to the electorate (vertical accountability), but several years can pass between elections. During this interval, horizontal accountability, in the form of independent checks and balances, plays an essential role in safeguarding government integrity (O'Donnell 1998). An effective legislature is one which performs its horizontal accountability functions in agreement with the wishes of the voters.

Legislatures around the world have the constitutional power to oversee budget formulation and implementation. Legislatures participate in the governance of the budget by approving budget allocations, overseeing budget execution, and controlling budget performance. Effective legislative budgetary oversight enhances accountability, participation, and transparency, which are all concepts associated with a strong democracy. Besides, legislative budgetary oversight becomes even more important in times of economic crisis, such as the world financial crisis that started in 2008. In fact, central governments around the world are trying to address the fallout from the global economic crisis, which has led them to make painful decisions in respect of spending reductions and tax increases. The best way to improve the allocation of public finances is through budget systems that are transparent, open to public engagement and scrutiny, and have robust oversight institutions (International Budget Partnership 2012). In fact, a lack of transparency and effective oversight of the vulnerability of government debt and deficits to external shocks contributed to the recent economic crisis (IBP 2010).

### Use of Preventive Policies

Preventive policies should include clear ethical rules, transparency in all that regard public management, awareness-raising measures, the creation of a culture of integrity within organizations, effective internal control mechanisms, easy access to information of public interest, effective systems to evaluate the performance of public institutions, etc.

### Financing of Political Parties

Unfortunately, corruption has abounded in the illegal financing of political parties. Vote buying and other improper practices to influence the electorate have also been observed in several countries. Although not all, most developed countries have made changes to their legislations on party financing, including gifts, and have raised their standards of transparency. It is now a legal requirement for political parties to publish their accounts, and in this respect, the GRECO recommendations have proved very useful.

### Effectiveness of Anticorruption Agencies

The factors that influence the success of anticorruption agencies are, among others, the assurance of independence and absence of political interference, selection based on merit and the staff promotion, multidisciplinary collaboration between operational teams and other institutions, fast access to databases and knowledge, and the provision of necessary resources and skills.

### External and Internal Control Mechanisms

Control mechanisms play an important role in preventing and detecting corruption within public authorities. Deep-rooted corruption cannot be tackled without an integral approach that aims to improve prevention and control mechanisms throughout public administration. The Courts of

Auditors has an important role in promoting anticorruption reforms, and it is now obligatory to alert the relevant authorities to suspected cases.

It is also necessary to reinforce internal and external control mechanisms at the regional and local level as these have frequently been shown to be weak and uncoordinated.

### Rules on Conflict of Interest

Conflicts of interests arise when civil servants act, seek to act, or seemingly act in a way that benefits a private business. These conflicts of interest in decision-making, the awarding of public funds, and public tenders, in particular at the local level, are a recurring pattern in many countries.

Work mobility between the public and private sectors is essential for the functioning of a modern society, and it can bring huge benefits for both sectors. However, it does imply the potential risk that politicians and former civil servants may divulge reserved information regarding their former functions, while ex-private sector workers may occupy public posts that lead to conflicts of interest with their former employers.

Among the many formulas to tackle this is the creation of specialized bodies to carry out controls, or ethics committees in the parliaments or assemblies, which have the power to impose sanctions, even though party discipline and self-control may not be as effective as it should in this sense. Likewise, there is a need to introduce the practice of canceling contracts signed or carried out in situations of conflict of interest or the recovery of the estimated cost of damages sustained.

### Transparency of Lobbying

In the complex world of drawing up public policies, it is desirable for different administrations to participate in an ongoing dialog with citizens. All the interested parties should be able to express their opinions, and this should be done in a transparent way. Lobbying by the various groups can increase the risks of corruption in order to capture the attention of the regulator or legislator, so it is therefore convenient to have mechanisms in which to handle these types of activities. This could be achieved either through legislation or by voluntary registration of lobby groups. Such mechanisms would favor clearer and more transparent relations between public authorities and outside interested parties and so reduce the risk of corruption.

### Asset Disclosure

The publication of the goods owned by politicians and civil servants should be a practice that contributes to consolidating their responsibilities, while at the same time guaranteeing greater transparency and detecting possible cases of unjust enrichment, conflicts of interest, and incompatibilities, as well as helping to detect and investigate possible corrupt practices.

### Criminal Law

Faster and more efficient legal proceedings need to be brought in, supported by tools to combat corruption, including a clearer definition of crimes.

### Capacity of Law Enforcement, Prosecution, and Judiciary

Repressive measures are not enough in themselves to tackle corruption effectively. However, the capacity of the legal system to impose criminal sanctions as deterrents is important and sends out a clear sign that corruption will not be tolerated.

The independence of the judiciary and high ethical standards within it are essential for the objective and impartial handling of cases of corruption, free of any undue influences. What should never be permitted is lack of transparency or discretion in the appointment, promotion, or dismissal of attorneys working on cases of corruption, and this holds also for attempts to discredit the institutions that combat corruption and the leaders of these for no apparent objective reason. Neither is it desirable that politicians interfere in the management and functioning of the anticorruption police units, while the latter should be accountable for all their actions.

### Transparency Policies and Freedom of Information

Openness and transparency should serve as a deterrent for corruption and can help to detect transgressions as and when they occur.

### Whistleblowers' Protection

Suitable mechanisms need to be set up within the public administration for the reporting of irregularities and illegal acts. However, reporting such behaviors can be hampered by a general reluctance to report these within the organization itself and because of fear of reprisals. It is therefore fundamental to build up a culture of integrity within each organization and create and make people aware of effective protection mechanisms that reassure potential whistleblowers.

## Public Procurement

Public tendering is an important element of EU national economies. Approximately 20% of the GDP of the EU is spent each year by public administrations on acquiring goods, works, and services. Given the financial flows this generates, public procurement is an area that is prone to corrupt practices. As an example, according to an investigation carried out in 2008 (Medina 2008) into public procurement and corruption, the added costs in a contract ensuing from corrupt practices could be between 20% and 25% and in some cases even as high as 50% of the total cost of the contract. The OECD (2009) in its Principles for Integrity in Public Procurement states that "weak governance in public procurement hinders market competition and raises the price paid by the administration for goods and services, directly impacting public expenditures and therefore taxpayers' resources. The financial interests at stake, and the close interaction between the public and private sectors, make public procurement a major risk area."

A 2013 study (PricewaterhouseCoopers and Ecorys 2013) on identifying and reducing corruption in public procurement in the EU concluded that in 2010 the overall direct costs of corruption in public procurement for only five sectors (road and rail, water and waste, urban/utility construction, training, research and development) in eight member states (France, Italy, Hungary, Lithuania, the Netherlands, Poland, Romania, and Spain) ranged from EUR 1.4 billion up to EUR 2.2 billion.

In the above study, four main types of corrupt practices were identified: (1) bid rigging (in the form of bid suppression, complementary offers, bid rotation, and subcontracting) when the contract is "promised" to one contractor with or without the consent of public officials; (2) kickbacks, when the public official requests or accepts a bribe which will be accounted for in the tendering process, including administrative processes; (3) conflict of interest; and (4) other irregularities including deliberate mismanagement/ignorance when public officials do not carry out proper checks or follow the required procedures and/or tolerate or ignore overt deliberate mismanagement by contractors.

Construction, energy, transport, defense, and healthcare sectors appear to be most vulnerable to corruption in public procurement.

In several countries where allegations of illegal party funding emerged, there were situations in which such funding was allegedly granted in exchange for beneficial decisions regarding the award of public contracts. In some other cases, the allegations concerned too close links between businesses and politicians at the central or local level, which encouraged alleged corrupt practices linked to the award of public contracts.

In some municipalities and regions, a strong consolidation of "clientele" networks around small interest groups has been developed. Most of the cases have concerned charges or allegations of illegal party funding, personal illicit enrichment, diversion of national or EU funds, favoritism, and conflicts of interest. In a few member states (Bulgaria, Italy, Romania), there have been cases in which some organized crime leaders at the municipality level established their own political parties or infiltrated municipal councils to exert influence over local law enforcement or the judiciary and to rig public tenders. In order to address this risk, some municipalities have implemented anti-corruption measures such as establishing systems for internal financial management and control.

In Spain, for example, and given that public tenders and contracts have been one of the main focuses of corruption, Transparencia

Internacional España has published 45 measures for transparency and prevention of corruption that are perfectly exportable to other countries (see http://transparencia.org.es/wp-content/uploads/2015/10/sesenta_medidas_propuestas_tie.pdf).

## Conclusion

Of all the possible types of corruption (in this respect it can be seen in the UNODC 2003), the focus here is on political corruption, which is the misuse and abuse of public power for illegitimate gains of a normally private and secret nature. The opposite of political corruption is transparency. We can, therefore, talk about the level of corruption or the degree of transparency in a country or area.

All types of governments are susceptible to political corruption, and the most common forms are illegitimate use of privileged information, sponsorships, bribes, extortion, embezzlement, prevarication, despotism, cronyism, co-optation, nepotism, and impunity.

The following causes of corruption can be cited:

- Lack of social awareness
- Lack of education or of a culture of commitment
- Antisocial personalities and megalomania
- Biased perception of the degree of existing corruption
- Underrating the chances of being discovered
- Effective impunity in acts of corruption
- Party corporatism
- Social models that transmit a lack of values
- Excessive discretionary powers of the civil service
- Concentration of powers and decision-making in certain government activities
- Discretion and collegiate decisions
- Economic or legal control of the media which prevents corruption cases from becoming public
- Too low salaries
- Lack of transparency in information concerning the use of public funds and about decision processes
- Inefficiency of the public administration
- Extreme complexity of the system

Clearly, if at the institutional and judicial level a firm position is adopted with respect to the various types of corruption, this will decrease. So, repression and sanction with regard to acts of corruption should exist and be increasingly reinforced.

Combating corruption involves two complementary focuses: one concentrating on acts that have been performed and the other on preventing further acts. Among the latter, one can point to the transparency of the institutions in their use of public resources, more freedom of the press, and the legal review of the norms relating to judicial power in order to achieve a greater independence of governing and legislative power.

In the European context, the European Commission is pursuing a coherent approach for shaping EU policies on the fight against corruption. In addition to stronger monitoring and the proper implementation of existing legal instruments, the Commission foresees a wide range of EU-level actions to adequately tackle corruption, as pointed out in the communication on fighting corruption in the EU. The Commission has proposed to revise the existing legal framework on confiscation of assets, which is a priority in the fight against organized crime, including in cases of corruption. Cooperation also is strengthened with Europol (to step up its efforts to combat corruption, including through regular threat assessments), Eurojust (to further facilitate the exchanges of information on cross-border corruption cases), and CEPOL (to propose specific training programs for law enforcement officials on cross-border corruption investigations).

Furthermore, it is a paramount issue to strengthen the socio-institutional fabric. Education in values could be one of the pillars for this, as could more open and more transparent procedures when managing money and implementing financial transactions, including the use of the so-called telematic, or digital, money, which makes it easy to trace long chains of transactions.

# Accountability and Democratic Administration

Ali Farazmand
Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Answerability; Egalitarian administration; Liability; Responsibility, Representativeness; Upholding and promoting democratic values

## Definition

The quality or state of being accountable; an obligation or willingness to accept responsibility or

to account for one's actions; being accountable for and responsible for one's past or current actions and inactions; answerable to authorities, people, and stakeholders for one's past and current behaviors and inactions; administration involving citizen participation and upholding democratic values of representation, responsiveness, and responsibility.

## Section: Ethics and Accountability

### Introduction: The Accountability Problem

The market-based ideological reforms in public service and administration in the last 30 years or so have caused profound transformations in public service and administration around the world. While they may have worked in some places, other parts or countries of the world have experienced severe negative impacts. Governments are different from business enterprises, their functions are different, and their missions or purposes are not the same as business corporations. Yes, all government organizations must perform with efficiency but efficiency is not their main purpose; it is only a means to an end, and one of the ends of governments is to serve justice and fairness as well as equal treatment and equity for all their citizens. Achieving end goals using legitimate means is essential to government organizations; ignoring or bypassing required processes and legitimate means presents significant problems of potential violation of laws and of accountability in assuring democratic administration. Scholars have been debating this issue extensively, particularly with reference to performance and accountability, for the last three decades or so (Behn 2001; Farazmand 2002). The question is: "In a rush to produce results with efficiency, what should be done with the potential accountability problems in public service and administration, and how to achieve accountability and democratic administration in the age of predatory globalization?"

Perspectives on democratic accountability abound with little agreements among them (Behn 2001). Just as perspectives on globalization vary, concepts and theories of accountability vary representing different ideological as well as political narratives. Classical and neoclassical economic theorists favoring corporate globalization often complain about the lack of accountability in bureaucratic administration and by unelected professional bureaucrats or administrators who by virtue of their expertise and legal appointment are involved in the public policy process of formulation, development, and implementation. To them, only elected officials are accountable to citizens in a democratic polity. To these scholars, the problem of accountability is solved by sweeping privatization, marketization, and commercialization of public services, government agencies, and their functions.

However, aside from ideological orientations, the problem of accountability is much wider and more comprehensive; it encompasses a spectrum of public life well beyond elected or unelected officials. It is not uncommon to hear or read about corruptions and accountability breaches among elected or appointed officials on all partisan lines. Here, scholars share one point in common, and that is corruption and accountability lapses in public service and administration. They differ on how to achieve accountability to citizens.

The accountability problem noted above is mostly related to the industrialized countries (also called industrialized democracies) where normal and periodic elections are held to select public officials who according to the constitution are expected to be responsible and accountable to broad-based citizens. This does not mean political officials are always accountable, but the formal institutional arrangements – separation of executive, legislative, and judicial powers – require accountability to citizens. The story is much different in less industrialized and developing or underdeveloped nations, where elections are rare, authoritarianism is the rule, and corruption and lack of accountability are rampant, and the infrastructure for achieving accountability is either weak, not working properly, or lacking all together.

### Perspectives on Accountability Problems

Generally, three perspectives address the accountability problem with solutions. One is the broad

"ruling class" perspective represented by Marxian and neo-Marxian theories. According to this perspective, a small group of ruling class in capitalism lives, prospers, and rules on the principles of money and profits, exploitation of the majority working class, and dispensation of money as a lubricant to political system perpetuation. It uses a functionary body of middle-class "agents" in charge of administration, management, supervision, and those involved in politics, whether partisan, programmatic, bureaucratic, or policy in nature. To this perspective, capitalism corrupts and corruption is functional to system maintenance and enhancement, and citizens are powerless and irrelevant as power elites decide and rule through its public as well as private corporate institutions and organizations. Accountability, therefore, is more a flawed concept than a serious concern. Corporate globalization of the world (Farazmand 1999) and the surge of predatory globalization (Falk 1999; Galbraith 2006) tend to have reinforced this critical perspective citing consequential examples: causing accentuated problems of corruption, loss of accountability through mergers and megamergers, as well as sweeping privatization and outsourcing of public institutions and funds, the widening have and have-not gaps forcing millions of working class people in a race to the bottom, and lack of accountability among corporations and top political, administrative/bureaucratic, and military elites to anyone (Korten 1995; Morgan 2006).

The second perspective is offered by scholars less concerned with partisan or social class lines; they are concerned with the problems of accountability in all respects. To them, all officials in public life are and should be subject to public scrutiny, and their actions or inactions must be subject to accountability. Any breach of accountability must be punished by constitutional, legal, and financial sanctions, regardless of the level or position of officials in the system. Most public administration scholars, philosophers, social scientists, and processionals committed to the noble profession of public service may fall in this category (see, e.g., Jurkiewicz 2012; Thayer 1997). To these scholars, theories of virtue ethics and categorical imperatives, as well as "principled professionalism" (Farazmand 2002, forthcoming), complement and reinforce this perspective. While approaches may vary among these scholars, there are many who specifically argue that constitutionally empowered, neutrally competent, and independent professional "civil servants" should be given authority to act as "guardians" of public trust and broad public interests (Thayer 1997; Rohr 1989).

The third perspective is that of the conservative public choice theory. To this perspective and its extended ideology of NPM, the solution is privatization, marketization, and outsourcing (see, e.g., Behn 2001).

The problem of accountability is many dimensional, but it should be addressed at both micro and macro levels. At the micro level, the individual incidents of corruption, conflict of interests, wrongdoing, and unethical conducts explain cases of the problem, which demands measures of safeguard and protection. At the macro level, the broader issues of citizen trust in government and democratic administration are at stake. These problems demand solutions to the challenge of accountability in various ways.

### Solutions to Accountability Problems

The solutions to the macro and micro accountability problems are also offered by three perspectives: One from the public choice theory noted above, which argues for democratic administration through overlapping jurisdictions, organizational overlaps, taking work and politics as well as services to the local levels, where people/citizens can and should directly engage local politicians and public managers, holding them accountable. Another one is the Marxian and neo-Marxian class view that offers social revolutions replacing capitalism with socialism as a way out of class exploitation, corruption, and systemic changes. The working class should take over, control, and manage public resources through democratic centralism and other means of collective decision-making and administration that would serve the democratic rights of the vast majority of working class people. The third theoretical view offering solutions to accountability problems is the theory of representative bureaucracy and democratic

administration achieving bureaucratic accountability. This perspective argues that democracy is served by bureaucratic representation as an institutional mechanism.

The bureaucratic democracy model argues for (1) representative bureaucracy and (2) organizational hierarchy:

1. A representative bureaucracy is an institutional system that provides social and policy representations of citizens in the bureaucracy and administration, one that is both responsive and accountable to broad-based and special citizenries. According to this perspective, social representation is expected to afford reflection of social groups – racial, gender, and ethnic based – who by performing tasks in the bureaucracy serve democracy and democratic interests of citizens.
2. The second way the bureaucracy serves democracy and democratic accountability is through democratic administration hierarchically organized: public organizations are organized hierarchically, at the top of which the directors and chiefs are appointed by elected officials or politically appointed bosses and their political appointees or political executives (an example is the Secretary of State appointing his/her political executives, who would then appoint strategic officials who then appoint key administrators and so on all the way down to the lowest level of the system). Career officials appointed to positions by the virtue of their specialized knowledge, expertise, experience, and skills perform tasks and report upward to the bosses, who provide accountability to political officials – both appointed and elected – who are to be held accountable to citizens, hence, achieving bureaucratic accountability. According to this perspective, bureaucratic democracy assures accountability through organizational structures and processes that keep authority and accountability in balance.

The above ideological and institutional solutions to accountability problems face enough obstacles in Western industrialized countries where a degree of democracy is afforded through periodic elections by which politically elected officials can be unseated or voted out and by certain formal institutions – the court, the legislature, and procedural mechanisms embedded in the governing process. The problem becomes much worse and complicated in less industrialized, developing, and underdeveloped nations, where elections are rare and rational organizational and administrative behaviors are either lacking, or weak, or ignored and overlooked, and personal and family connections often overrule institutional rules and laws. These nations, often erroneously dubbed "third-world" countries, display significant variations. Three groups of nations appear on a continuum: On the one end, some are more industrialized than others and closely resemble much of the industrialized nations of the West, hold regular and free elections, value and respect the rule of law, and have built significant institutional, cultural, political, legal, judicial, and religious infrastructures for achieving accountability in public service and administration. Some of them are advanced and have institutional systems of governance and administration with period elections at local and national levels and have multiple checks and balance systems, including procedural and institutional measures of accountability, anticorruption laws, codes of ethics, and strict administrative systems enforcing them. At the other extreme end of the spectrum lies a group of nations governed by absolute monarchies that lack any separation of powers and any form of accountability and ethical infrastructures. In between the above two extremes are those countries that may have formal institutional mechanisms in governance and administration on paper, but they actually mean little or nothing in practice and implementation. Most of these nations also lack any form of elections, and public service and administration is often at the mercy of personal and family connections or some sort of cultural, political, and religious traditions. Accountability is often a matter of challenge than opportunity, arbitrary rule is expected as a way of life, and corruption is common practice. The variations in institutional mechanisms of accountability explain complexity

of governance and traditions among the so-called third-world countries, a word of more stigma than reality. Fred Riggs (1964) in his revised perspective of "prismatic society" in which the duality of tradition and modernity acknowledged the fallacy of his original formation admitted, perhaps under the influence of Dwight Waldo, that development is an endless process, and that many developing countries manifest high level of development and industrialization, while many industrialized and developed nations display many areas of underdevelopment and developing. This notion was pronounced clearly by Dwight Waldo, who argued that both development and democracy are two terms in similar continuum processes – developing countries share a great deal of development with developed nations, while the latter share a great deal of underdevelopment or poor conditions common in underdeveloped and developing nations. Similarly, democracy is a continuum, a constant striving for improvement, participation, and determination of one's destination in political and individual life (Waldo 1980/1992). Accountability, like development and democracy, perhaps is and should be treated as a continuum, a process that tends to achieve the ideal end of absolute accountability.

One more factor on accountability of the so-called third-world countries needs to be noted. Most developing or underdeveloped nations have suffered colonial rule in which foreign colonials powers were the absolute masters dictating all rules and norms of government and administration in the colonies, arbitrary rules were common and unquestioned, and institutional mechanisms were created to ensure efficiency in colonial administration. Most of these nations, therefore, learned nothing but a continuation of such practice even long after gaining formal/official independence. After independence, most of these nations have been under continuous neocolonial or imperialist influence and domination, their political processes if chosen democratic paths have been under foreign power's financial and political influence, and some of them experienced popular and democratic governance systems dedicated to fighting corruption and institutionalizing mechanisms of accountability and sound governance, but had faced tragic military coups designed by foreign/colonial or neocolonial powers and carried out by local corrupt agents who served them.

Two examples of such historical experience are (1) the bloody military coup that toppled the democratically elected Prime Minister of Iran Mohammad Mosaddegh in August 1953 under the US Central Intelligence Agency (CIA) in harmony with the British imperial agents (Haliday 1979) and (2) the bloody military coup led by the CIA and the American corporation ITT against the democratically elected President of Chile, Salvatore Allende, on September 11, 1973 (Morgan 2006). In both cases, absolute dictatorship was imposed on peoples and institutions of Iran and Chile for the next 25 years. Formal bureaucratic institutions were created while legitimacy was lacking, formal accountability mechanisms were put in place but no one believed in it, and corruption ruled while talk of modernity spread in the Western capitals with little meaning or respect in Iran and Chile.

As for the solutions to the problems of accountability in the third-world countries (notwithstanding the fact that while countries like China or Singapore is considered third-world but they both display a high level of modernity and development and in the case of China with high industrialization), even higher than the advanced countries of the western "developed" nations, several mechanisms of accountability have been instituted in those nations. Anticorruption laws, organizational reporting mechanisms, and political as well as judicial investigations are but a few such mechanisms in place, yet formal institutions are one thing and real practice is another. Corruption is an infectious disease; once started it spreads like a plague and few can escape it. Ideological solutions to accountability problems are ineffective; they must be institutionalized both informally and formally.

## Analysis and Conclusions

The above theories and perspectives on accountability and democratic administration offer positive

features, but they also carry serious problems of their own. For example, the public choice theory and NPM solutions to accountability problem through privatization and outsourcing may actually cause more accountability problems they claim to solve, as outsourced contractors and subcontractors may be responsible to contract bosses but not to citizens, and privatized public functions are accountable to private stakeholders not public citizens. The traditional administrative models may have organizational accountability mechanisms in place, but the slow process of bureaucratic system may undermine such accountability measures in action as well. Moreover, bureaucratic/administrative elites often engage in intimate relationships with political and partisan elites acting as key actors in the policy and administrative systems; they may hinder rather than enhance public accountability in administration, especially when the interests of powerful business elutes are at stake. The concept of "iron triangles" more often hinder than help achieving high-level accountability in capitalist democracies.

Similarly, the theory of representative bureaucracy may offer a degree of democratic administration and democratic accountability, but there is no guarantee that those ethnic-, racial-, or gender-based employees in bureaucratic positions would necessarily represent and promote the interests of the groups or classes with whom they are associated with. Many people once positioned in key spots may forget where they came from and may not represent or promote the interests of the poor and working people in practice they are supposed to represent. Besides, all bureaucrats must by the virtue of their loyalty to the Constitution serve the broad-based interests of the public.

Finally, a fourth perspective on the accountability problem has recently emerged with the rise and spread of "predatory globalization" with many complications and implications worldwide – this problem too is in search of solutions. This perspective has raised the emergence of what Farazmand has called an "impossibility theorem" in achieving accountability in the age of predatory globalization (Farazmand 2012).

The logic applied is quite simple: predatory globalization is based on predatory corporate capitalism (though not all capitalist enterprises are predatory), which aims primarily at maximizing surplus values/profits at virtually any cost to others – it seeks absolute profit. When applied globally, globalization becomes predatory through its relentless push and pursuit for such absolute rates of profits and uses every possible means, including violence of war – to achieve its strategic goals. In pursuit of such goals, it seeks monopolistic and oligopolistic strategies and alliances to succeed, and if faced with local challenges or obstacles, it would seek and apply intervention – military as well as political and economic pressures – from its "state" power. As noted earlier, examples of such predatory global corporations and predatory globalization are (1) the September 11, 1973, Chilean bloody military coup staged by the US Central Intelligence Agency (CIA), General Electric (GE), International Telephone and Telegraph (ITT), and other corporations, which was carried out by the local agent General Pinochet who, after killing the democratically elected president Salvatore Allende, denationalized and reprivatized the Chilean copper industry back into the hands of the above corporations and put the Chilean people under repression, humiliation, and corruption (Morgan 2006: 320–321) and (2) the August military coup d'etat of 1953 in Iran led by US CIA, which toppled the democratically elected Prime Minister Mosaddegh and reinstalled the dictator Shah to power, who then restored the control of Iranian oil into the hands of the British and American corporations and ruled Iranian people and the government with repression, corruption, and arbitrary manner (Haliday 1979). Predatory capitalism and globalization have also been active at home in the USA, with a clear example of predatory lending in the housing market prior to the bubble burst of 2008 (Farazmand 2012).

Under predatory capitalism and predatory globalization, achieving public accountability is an almost impossible task. Maximizing profits and production is tantamount to complying with government regulations, even if applied, on quality, standards, and control of public funds – or "accountability" requirements. The more of the latter means the less of the former, and this is not

acceptable to giant corporate power structures. The financial and political abilities of powerful corporate elites to lobby and influence politicians and change or control national legislation to their benefit are now a reality hard to deny. It gives them an assurance that turns the power of the "state" to their benefit and undermines almost any major accountability measure in public service and administration to work (Farazmand 2012; Galbraith 2006). This simple logic makes it almost impossible to achieve public accountability on a mass scale, hence, an "impossibility theorem," which calls for a stronger role of independent governments in economy, politics, and administration.

The problem of achieving accountability is further complicated. At the micro organizational level, scholars (e.g., Rosenbloom 1995) note how difficult it is for citizens to hold public administrators accountable. This is due to several reasons: (1) administrators have specialized knowledge and expertise in various areas of public policy and management the general citizens do not have and cannot understand; (2) the language of bureaucracy is complicated with details of procedures, terms, and jargons; and (3) there are many legal obstacles and reasons, including national security and fear of lawsuits and why it is difficult for public citizens to obtain information from administrative agencies. To counter these obstacles, scholars suggest citizens becoming "bureaucrats themselves." This is another area of accountability subject that is understudied and in need of further inquiries.

Nevertheless, accountability like anything else can be learned, taught, developed, and practiced. Democratic administration demands multiple institutionalized mechanisms to achieve accountability, however imperfect they maybe. The future of public administration rests on these mechanisms if legitimacy is to be achieved. Political leaders and professional public administration need and can design and implement formal and informal institutional channels and systems to achieve democratic accountability in modern governance. Predatory globalization and predatory capitalism need to be tamed and reined in by democratic processes and institutions that engage mass people and communities. Laws need to be passed to ensue sunshine processes genuinely followed. The judicial systems in both developed or developing countries must rigorously uphold the laws and the constitutional provisions to enforce individual rights and punish corruption regardless of status and power of individuals or officials involved. Codes of ethics must be developed, and administrative systems must safeguard professional civil servants' relative independence from partisan or political pressures to resist political abuse and corruption of all forms; they should be considered as valued "guardians of the broad based public interests" (Thayer 1997) and rewarded for doing the noble job of "principled professionalism" (Farazmand forthcoming) in democratic administration.

Finally, organizational mechanisms of accountability can and should, despite obstacles noted earlier, be designed and institutionalized supported by political and legal legitimacy. This is a prescription that can work both in developing and developed nations. The latter nations have a global responsibility to promote transparency and accountability at home while preaching abroad and must demonstrate consistency in action as well as formal statements. Global institutions of governance must respect the rights of developing and less powerful nations as well as those of the developed and powerful ones. Democratic accountability is a two-way street; those in power demanding accountability from below must also demonstrate in action accountability to the powerless and the ruled.

## Accountability and Ethics

Kristin Reichborn-Kjennerud
Department of Public Management, The Oslo and Akershus University College of Applied Sciences, Oslo, Norway

Accountability is a concept that no one can be against. It conveys an image of transparency and trustworthiness. It is increasingly used in political discourse and policy documents. The concept has many meanings and is partly overlapping with other concepts such as "responsibility."

This chapter will first elaborate on why accountability is important. Subsequently different meanings of the concept will be presented. Lastly how the different meanings of accountability relate to the quality of government will be discussed.

### Why "Accountability" Is an Important Concept

People's natural inclination is to favor their own kind, whether it be family, friends, business associates, or other individuals or organizations that they have a close relation to. Modern democratic rule, on the contrary, has ethical universalism as an ideal. In this context it is necessary to move away from particularism and favoritism (Mungiu-Pippidi 2013). Many argue that accountability and control are a prerequisite for a functioning democracy. In a parliamentary system, the parliament controls the government. In a presidential system, the congress controls the president. The typical division of branches is into a legislature, an executive, and a judiciary. The intent is to prevent the concentration of power and provide for checks and balances. To safeguard that powerholders do not abuse of their powers, formal systems of laws, rules, and external and internal control have been established.

With democratic rule demands increase for better quality in government. Better administrative capacities come about when the public administration works efficiently and effectively. Systems of accountability are one key to securing good quality in government.

### Different "Meanings" of Accountability

Accountability is considered to be important. Mechanisms of accountability are usually incorporated in formal systems of accountability. Every public and private organization has systems of internal control and management to reduce risk and prevent misuse of their organization. In addition there are external controls such as supervisory boards and Supreme Audit Institutions as well as regional and city auditors that control public organizations. Often, nevertheless, power

relations and informal mechanisms of accountability are decisive in what sanctions are actually applied. In many contexts this means that the formal systems are overrun or are used only symbolically.

The concept of accountability can be used in diverse ways. Five of the most important meanings of accountability will be presented in the following.

Accountability does not only mean "accountability to formal systems" as described above. Another meaning of the concept can be "responsibility." "Responsibility" entails civil servants acting responsibly and ethically as a person. During World War II, this distinction was debated. Civil servants had acted unethically, but at the same time, followed rules and orders within the reigning bureaucracy that applied at the time. The accused civil servants would claim that they should not be held accountable, but at the same time, they had behaved irresponsibly (Mulgan 2000).

The second main distinction in meaning is between accountability to formal systems and accountability as a social mechanism. Accountability as a social mechanism is associated with the process of being called "to account" to some authority for one's actions. The framework is a descriptive model of who is obliged to explain and to justify his or her conduct to whom (called a forum). The forum can interrogate the actor and question the adequacy of the information or the legitimacy of the actor's conduct. The forum will pose questions and pass judgment, and the actor may face sanctions and consequences (Bovens 2005).

A third type of accountability is related to civil servants' ethics and concern for the public interest (public ethos). With public ethos professionals working in public organizations are loyal to their workplace, over other networks such as political parties, their family and friends, and criminal organizations such as the mafia or business affiliates. This mind-set will influence the efficiency and effectiveness of the public administration. Formal systems of control are not sufficient to secure well-performing public organizations because formal systems always can be manipulated. When civil servants work in the publics' best interest, they will produce better results.

The fourth main distinction is between accountability to formal systems and responsiveness to citizens. In reaction to a perceived lack of trust in government, there is an urge in many Western democracies for public agencies to be more responsive to citizens. More attention is payed to the role of nongovernmental organizations, interest groups, and customers or clients as relevant "stakeholders." There are demands for citizens to have a larger say in public service provision and for the public organizations to be more open and transparent. Public agencies and managers should be responsive to the public at large or to civil interest groups, charities, and associations of clients. The rise of the Internet has given a new dimension to this form of accountability (Bovens 2005). These five meanings of accountability are summed up in Table 1 below.

In the following I will elaborate on the concept "quality of government." Subsequently I will relate the concept "quality of government" to the different meanings of accountability presented in Table 1.

## The Quality of Government

Quality in government represents the payoff the taxpayers get from what they put in. In this meaning of the concept, "quality of government" equals good government performance. Government performance is the government administration's ability to deliver products and services economically, efficiently, and effectively to its citizens. These tasks are mediated through professionals in (or for) public organizations.

**Accountability and Ethics, Table 1** Different meanings of accountability

| Accountability as a social mechanism |
| Responsiveness to citizens |

Low-quality government institutions have tremendous negative effects on the health and wealth of societies (Bo Rothstein 2011). One of the interesting questions as regards organizations in general, and public organizations in particular, is therefore to what extent it would be possible to change the systems and culture in organizations so that they perform better. If low-performing public administrations would improve with increased quality outputs as a result, people's lives and quality of life indicators would improve. This could solve many of the world's problems, both in developing and more developed countries.

There has been accumulative steering and control in the public sector as a consequence of increased devolution and autonomy of state entities. These reforms came with New Public Management (NPM) reforms from the 1980s and 1990s. The price to pay for these reforms is more control and demands for more reporting and documentation (Christensen and Lægreid 2011). To be more concrete, this can both encompass external control such as audits, investigations, and evaluations and internal management and control systems (Reichborn-Kjennerud 2013). Examples of these kinds of systems can be management of objectives and results, lean production, business process re-engineering, total quality management, the Committee of Sponsoring Organizations of the Treadway Commission (COSO) framework, and self-assessments.

Delivering better services through stricter control of professionals is what NPM measures promise. At the same time, professionals themselves claim that this control produces adverse effects and reduces their performance. Fukuyama's solution is thus to trust the professions more; his argument being that controlling them through measuring outcomes is impossible in practice. Instead the capacity and autonomy of the professions need to be enhanced (Fukuyama 2014). Alina Mungiu-Pippidi, professor at the Hertie School of Governance on the other hand, argues that the road to a better quality in government goes through combatting corruption, which could entail the strengthening of administrative controls (Mungiu-Pippidi 2006). Bo Rothstein is also preoccupied with accountability and argues that impartiality in the exercise of power is essential to enhancing the quality of government (Rothstein and Teorell 2008).

How well control systems function is nevertheless difficult to assess because organizations not only encompass formal systems and procedures, but also culture. Control systems may have difficulty in accounting for these cultural biases. We can speak of systems and culture on different levels. There is the supranational level, the national level (macro-level), the organizational level (meso-level) which is infused with professional cultures, and the local level (microlevel). Culture will guide practice in how systems are used, and different practices can be more or less effective in different contexts.

## How the Different Meanings of Accountability Is Linked to the Quality of Government

### More Controls as a Consequence of NPM

The extent to which the quality of government will increase with NMP systems depends on how these systems are used. NPM systems come instead of, but more often in addition to, controls already existing in the government administration. This entails that the pressure from control and time used to satisfy control systems increase (Power 1997; Hood 1991).

With NPM civil servants ideally get more freedom to make dispositions locally. This may increase the risk of corrupt activity in some contexts because individual employees hold more powers and get better possibilities to misuse those powers. Interfaces with the private sector increase. Civil servants' public ethos therefore needs to be strong for such systems to function according to their initial intentions.

With NPM social mechanisms of accountability change because more attention is given to the users of public services. NPM techniques mimic private sector systems. Users are considered to be customers instead of clients. The users must therefore inform themselves on alternative products and services presented to them and make a choice.

On the other hand, NPM systems reduce the politicians' power over public organizations. When agencies get more autonomy, ministries or politicians can no longer give direct instruction. Often they instead operate as owners that elect a board. Their powers are thus reduced to electing or throwing the board. The politicians' powers are increasingly reduced the more private the chosen solutions are, for example, when public tasks are organized in fully or partly public-owned companies.

With NPM residents of a country are treated as consumers of products and services. Residents are nevertheless not only customers. They are also citizens. They can make their voice heard both in elections, through advocacy and lobbying and through protest movements such as "Occupy Wall Street," that has been a global protest movement against what has been perceived as an injust financial system. There has been increasing demands for responsiveness in public service delivery. This has put formal administrative and control systems under pressure. Often the formal systems are too rigid to open up for real participation from citizens organized in, for example, neighborhood organizations or as interest groups.

### Trust in Professions

Trust in government is measured by the OECD "trust in government" index (http://www.oecd.org/gov/trust-in-government.htm). Transparency International measures the level of corruption in different countries in their "corruption perceptions" index (http://www.transparency.org/research/cpi/overview). These indexes reflect to what extent citizens trust powerholders in their countries and their administrative apparatus. In many countries few citizens pay taxes because they expect the money to disappear into the pockets of public officials and their families and network. In many countries public positions are also distributed based on demonstration of loyalty to other networks such as family and political parties. These informal systems override the principle of meritocracy of a professional bureaucracy and cause the public administrations to work poorly. When practices of corruption and mismanagement are widespread, this decreases trust and the use of formal systems. Informal systems and patrimonial structures are instead where the real power lies.

In these sorts of systems, people employed in the public administration feel responsibility toward their networks rather than their workplace. When nobody within the public system abides by the formal system, individual employees neither feel obliged to do so. When nobody is held formally to account for breaking formal rules or when there are no consequences to breaking these rules, the informal systems and rules continue to prevail.

In bureaucracies where formal systems prevail over informal systems, citizens can expect to be treated equally irrespective of their background and status. Public ethos suffers in systems where informal systems override formal systems. When a majority of civil servants primarily are loyal to their own personal networks over their place of work, public interest is not safeguarded, and resources are not used in the publics' best interest.

Formal systems are still not always sufficient to secure public administration to function efficiently and effectively. The NPM trend is grounded in discontent with slow and poorly working bureaucracies. Many of these new NPM systems are designed to place responsibility and give incentives for obtaining results.

Believers in NPM have been accused of lacking in trust of professionals and reducing their autonomy, their aim being to improve service provision to users. Measures to increase competition, place responsibility more clearly, and increase administrative controls over professionals have been used to better the responsiveness to users.

### The Strengthening of Administrative Controls

With NPM measures there has been a proliferation in formal systems of control. The rise of auditing has its roots in political demands for accountability and control. Whether this rise in administrative controls will enhance the quality of government depends on several factors. Some researchers claim that the effect of audit and supervision is purely symbolic and serves merely to produce

assurance and a false feeling of security (Power 1997). Others have demonstrated that this control is effective in specific countries and contexts (Reichborn-Kjennerud and Johnsen 2015).

Several researchers point to deficiencies of performance management systems. Often these systems are not actually used or they distort employees' behavior in a manner that does not enhance the overall performance of the organization. When employees learn how the systems work, they understand how to manipulate them. This may produce suboptimal results instead of employees taking an overall responsibility for the functioning of their organization.

Many NPM systems place responsibility and demand results. If results are not obtained, this should produce sanctions and consequences. If administrative systems function suboptimally and do not take all important aspects into account, this may nevertheless be fatal to the performance of an organization. Often therefore such systems are implemented partially and are adapted to the existing context (Christensen and Lægreid 2011).

There may be many reasons for the implementation of NPM systems, one reason being that it will make the organization stand out as modern or organizations that experience challenges with existing systems want to try new ways of organizing. Repeated criticisms for lack of responsiveness to users can, for example, trigger politicians to organize for more competition from the private sector in public service provision.

### Impartiality in the Exercise of Power

A well-functioning bureaucracy is characterized by stable political rules and rights. For impartiality in the exercise of power to take place, these need to be applied impartially to all citizens. Written laws are nevertheless universal statements. Civil servants working in the public administration manage these rules. Rules cannot be applied precisely in every situation. Therefore civil servants must use discretion in unique cases (Rothstein 2011). Whether this impartiality enhances the quality of government will depend on the culture and practice in specific public administrations.

For discretion to be applied in a good way, responsibility and a certain public ethos are important. To some extent and in some situations, the principle of impartiality can nevertheless come in conflict with concerns for responsiveness. One example of situations where these principles may come in conflict is area-based initiatives (ABI). These are temporary organizations put up to improve certain geographical areas in cities. The ideal in these initiatives is often to improve the living conditions of those living there. These ABIs are often set up with the intention of being responsive to residents' suggestions and needs. Participation from residents nevertheless often comes in conflict with the formal administrative system that must pay attention to principles of impartiality. This tends to impair real participation from citizens and hamper responsiveness. Ideals of co-creation from citizens in public service provision thus seem to be difficult to implement in practice. In cases like these, accountability, as a social mechanism, takes on a deliberative dimension. The public administration is held to account through the media instead of through formal channels. Citizens make their voices heard through social media and in debates. They are protesting against decisions that affect their area, in ways that are unfortunate to them. In cases where local residents protest against decisions that affect them, certain principles of democracy may therefore conflict with principles of impartiality in the exercise of power.

### Systems and Culture on Different Levels

Formal accountability systems, administrative routines, and controls are enhancing the quality of government only when they are used according to intentions. How systems are used will depend on culture. Practice will differ depending on national cultures, but also within a nation where there are big differences in cultures and practices. Between organizations and even within organizations, across different departments populated by civil servants with different kinds of education, experience, gender and ages, practice will differ.

How civil servants, with their different background and cultures, perceive the world will differ. What they consider to be responsible conduct, public ethos, integrity, and how they relate to

norms that may affect how they practice their work will therefore vary.

In countries where access to the Internet is not widespread, debates in the radio may be the better way to hold powerholders to account. In high-trust countries, the Supreme Audit Institution and the parliament can play a role. In countries where the people do not trust the public institutions, NGOs and social media can be good instruments to use.

## Different Forms of Accountability and the Quality of Government: Implications

In this chapter I have discussed how different meanings of accountability are linked to the quality of government. The discussion revealed several dilemmas. To what extent the systems function depends on how they are used by civil servants and by citizens. Systems are used differently depending on administrative cultures. Ideally these systems open up for increased accountability, responsiveness to citizens, and competition, but the cost is often an increased burden of administration. How this plays out in concrete settings will impact on the quality of government.

Civil servants must exercise discretion in decisionmaking. That they have a public ethos and a sense of personal responsibility is therefore important. In general what systems of accountability will work efficiently and effectively, and how they will affect the quality of government will depend on existing systems and culture in concrete contexts. No system can be universally applied.

Upholding impartial systems and at the same time being responsive to citizens are challenging. Responsiveness to citizens often conflict with rules of political and administrative accountability. This is a dilemma. Rules cannot be applied too rigidly, and attention must be payed to how they apply in different context. How this is solved in practice will affect the quality of government.

Abiding by rules of formal accountability and at the same time emphasizing organizational learning and innovation in the public sector, through co-creation and other novel methods, are also difficult. How public organizations succeed in combining these different meanings and practices of accountability will be decisive for the quality of government in their countries.

There are mechanisms of accountability in every context. The question is whether mechanisms of accountability are formal or informal. In countries and cultures where informal systems prevail over formal systems, powerholders are not effectively held to account through the formal systems. In these cultures civil servants are loyal to personal networks rather than their place of work. The consequence is that citizens are not treated equally by the government, and some stakeholders are favored over others. Among other things recruitment to the public administration is often based on favoritism and is not meritocratic. This affects the quality of government negatively.

Having formal systems in place is no guarantee of an effectively working system. Ministries, control agencies, and anticorruption bodies are assumed to be morally above corruption. But they also have the most discretionary power and most opportunities to act corruptly. New democracies rarely attain fair governance. Most often they fail to impose normative constraints on predatory elite behavior. In order to place effective checks on officials, thereby creating real accountability, there must exist, at the grassroots level, an active and enlightened citizenry (Mungiu-Pippidi 2013).

Also, for good governance to prevail, the belief in the superiority of ethical universalism over particularism as a mode of governance must be present in a majority of active public opinion, including a fraction of the elite. Research has shown that four factors must be present to secure a civil society that can foster real accountability: a prevailing societal norm of ethical universalism, widespread collective action, a dense network of voluntary organizations, and participation and political engagement of the people (Mungiu-Pippidi 2013).

In a society dominated by particularism, it is more convenient for individuals to strive to become part of the privileged group than to try to change the rules of the game. At the same time,

there must be some sort of critical mass that favors ethical universalism in a society. Individuals must therefore be mobilized to wanting change. Civil society movements that start out loosely organized need to become more institutionalized and specialized (Mungiu-Pippidi 2013).

Internet access is closely associated with control of corruption. Opening an Internet cafe in every village may be more effective than establishing anticorruption agencies (Mungiu-Pippidi 2013).

Through the Internet and other means, sustainable collective-action networks must be built until society reaches a reasonable level of normative constraints. This is to secure that corruption fighters do not remain isolated and exceptional (Mungiu-Pippidi 2013).

# Accountability and Ethics in Nonprofit Organizations

Christopher Corbett
Albany, NY, USA

## Synonyms

Boardmember; Director; Trustee

## Definition

These definitions describe various aspects of accountability and ethics used in this entry to promote greater understanding of, as well improvement in, the ethical environment and governance of nonprofit (NP) organizations. Some definitions are substantially, or verbatim, from Corbett et al. (2016).

Accountability: A process or rule by which a responsible individual or group is subject to record, report, and/or justify matters occurring under one's jurisdiction to other stakeholder(s) internal or external to the NP. External stakeholders commonly include the public and government officials.
Ethics: Value-based norms, rules, or standards of behavior acceptable within, or expected of, NPs.
Fiduciary Duties: The three duties of nonprofit boards commonly reflected in laws across state jurisdictions: *the duty of care*, *the duty of loyalty*, and *the duty of obedience*.
Internal Controls: Refer to all NP governance procedures and processes, including the bylaws, as approved and authorized by the NP's board, that shape or control organizational behavior.
Organizational Self -Regulation (OSR): As applied to the NP sector, refers to formal efforts and processes performed by an organization on its own behalf that establish and monitor compliance with written principles, standards or regulations, or laws, where enforcement provisions are prescribed internally without government involvement (Corbett et al. 2016).

## Introduction

Improving ethics and accountability in nonprofit organizations (NPs) is highly complex, yet clearly a most admirable and worthwhile goal.

Many challenges are evident. Values are subjective and vary widely depending on many political, social, cultural, religious, economic, and geographic norms and factors. The resulting wide diversity of values complicates reaching agreement on ethical values, impairing and impeding ethical decision-making. Yet there are ethics and accountability standards that have been identified that apply widely. This entry will identify several and provide a solid starting point for building consensus on improved ethical processes at the organizational level.

Accountability presents challenges of its own, including measurement, compliance, and enforcement to name a few. Moreover, the potential points of measurement and reference are many. To whom is the NP accountable? Is that internally to donors, management, or board or externally to public, other stakeholders, and government officials or to all?

Given such complications, coupled with the nebulous nature of ethics and accountability across culture, as well as very different regulatory regimes in which NPs operate cross-nationally (Jordan and van Tuijl 2007; Sidel 2010), can progress be achieved? This entry's premise is systematic efforts to achieve progress are possible and well worth the effort given the benefits of improved NP functioning and a stronger voluntary sector to advance the common good in developed and developing countries where ethical needs are great as well (Spector 2012).

A second premise is the following: while NP ethics and accountability occur in the context of different social, cultural, and political environments with varying degrees of freedoms of speech, association, and religion, commonalities in ethics and accountability across nation and geography can be found or fashioned, where primary focus is to improve accountability and ethics through changes implemented at the *organizational level*. This goal is to improve *organizational self-regulation* through improved ethics and accountability in the United States and beyond, yet with awareness of many other existing and potential levels of regulation that lie outside the organization (Corbett et al. 2016).

Why is the organizational level the point of focus and intervention? It is the organizational level that falls directly within individual NP control. Focus here also presents opportunities for preventing organizational failures through improved ethics-based governance policies, processes, and internal controls, such as called for by Chait et al. (1996), including those widely applicable or where not applicable, to illustrate potential frameworks for improving ethics and accountability that can be adapted or tailored to better meet differing country-specific conditions, including organizational, stakeholder, and government needs.

This entry also describes various issues of implementation, including the often neglected but critical need to address *enforceability*.

This is done in the context of introducing system level change so consensus-based ethical and accountability standards and processes are built into NP operations, permanently improving the ethical climate despite routine leadership turnover.

## Conceptualizing Accountability Across Geographic Bounds

### Assessing the Legal Setting: Who Is Legally Responsible?

Accountability can be viewed as a process or rule by which a responsible individual or group is held to some standard. Given organizational level focus, attention is properly primarily directed to those legally responsible for NP governance. In the United States, the NP board members are legally responsible, sometimes referred to as directors or trustees.

While the board has power to delegate, board members are culpable for accountability failures. This legal responsibility is evident from the common NP practice of acquiring director and officer insurance, which indemnifies board members, typically required in NP bylaws (Rosenthal 2012). This insurance protects against most legal exposure for actions taken as board members, except criminal law liability (Hopkins 2007). Thus, the focus here is on the board or in other jurisdictions those legally responsible, and culpable, for NP failures or malfeasance.

### Board Accountability: What Standards of Performance Apply?

Having identified those legally responsible, what standards of behavior apply? While some variance across NPs is expected, there are standards very common, if not universal, and relevant across different legal and geographic jurisdictions. Ideally, the goal is to identify relevant standards of behavior across many NPs and jurisdictions that can be applied to board members or others deemed legally responsible.

What are board members accountable for? What standards broadly apply? According to Hopkins (2007), board member accountability can be demonstrated through effective discharge of their *fiduciary duties*. These duties apply to board members as they are collective duties of the entire board and require active participation of all board members. The concept of *fiduciary duties* can be briefly summarized as follows:

*Duty of care*: the duty of care requires board members be reasonably informed, participate in decisions in good faith and comply with filing requirements

*Duty of loyalty*: the duty of loyalty requires board members to exercise their power in the interest of the nonprofit disclosing or avoiding conflicts of interest

*Duty of obedience*: the duty of obedience requires board members to comply with all federal, state and local laws, adhere to NP bylaws and be guardians of the mission.

These *fiduciary duties* are similarly described by Rosenthal, who notes their applicability across many states in the United States. Rosenthal notes while these duties may be expressed somewhat differently in different states, "...at their heart they express the oldest and most fundamental obligations of directors – and also of officers – to the organizations they run." (2012, p. 8).

Just as these three *fiduciary duties* apply across dozens of states in the United States, each with different legal jurisdictions, there is reasonable basis to apply the concept of *fiduciary duties* as potentially applicable across various national and geographic bounds. *Fiduciary duties* are very similarly described by both Hopkins (2007) and Rosenthal (2012). They provide valuable insight into accountability standards reasonably expected of, and applied to, NP boards.

These *fiduciary duties* broadly describe responsibilities and performance expectations and standards. They also provide a useful framework upon which supporting governance and ethical principles may be built. This creates further substance to develop more specific standards and processes for measuring, improving, and achieving accountability by and through boards responsible for NP governance.

## Conceptualizing Ethics Across Geographic Bounds

### What Ethical Values or Standards Should Be Applied?

As noted, values are subjective and vary widely depending on many political, social, and economic factors. Yet, despite differences, is it possible to identify core or common ethical values that are highly relevant and widely apply?

It has been proposed that certain foundational or core ethical values are widely applicable to NPs. For example, White (2010) identifies "four pillars of ethics" which include transparency, disclosure, avoiding conflicts of interest, and oversight (p. 168). In his book on integrating ethics into NPs, White's view is essentially that incorporating these four ethical principles into board decision-making and behavior is the idea of good governance.

These four "pillars of ethics" appear a potentially valuable option for application across NPs and nongovernment organizations (NGOs) across national and geographic bounds. They provide a starting point for building consensus among internal and external stakeholders, on these, or additional, or on different, core ethical values that may be equally or more compelling, as determined by stakeholders in different national and geographic settings.

## Evolving Ethics and Accountability Through Professional Codes of Conduct

Intense efforts and many resources have been expended to improve ethics and accountability. In the United States, over some 20 years, many state associations developed their own codes of conduct. In a study of state associations, Bromley and Orchard (2016) found 24 of the 45 associations examined nearly half developed codes of conduct. The research traces the development of professional codes resulting from various scandals, as well as the United States federal government's passage of legislation: the Sarbanes-Oxley Act of 2002 (SOX) to increase accountability. While SOX was directed primarily at for profits, two provisions apply to NPs, by establishing criminal penalties for whistle-blower retaliation and record destruction (Jackson and Fogarty 2006). These federally imposed sanctions have forever changed the NP regulatory environment in the United States, and other national jurisdictions may follow as well.

The legislation is also very important as while it set government-mandated ethical and accountability standards at for profits, many nonprofits assimilated or voluntarily self-imposed some or many standards. One significant implication is, as ethics and accountability evolve for NPs across nation, culture, and geography, their development and evolution must be viewed in the context of the regulatory, political, and social environments within which they operate, including a wide array of key stakeholders such as government officials (elected and unelected), other NP and industry representatives, donors, taxpayers, and general public. This wide diversity of stakeholders reveals the essential role of collaboration to achieve consensus on precisely how ethics and accountability must be structured to achieve and improve NP governance.

### A Model Code: Independent Sector's 33 Principles of Good Governance and Ethical Practice

Beyond state-specific codes of conduct, there is precedent for codes developed at industry level that cut across state bounds. Moreover, there is strong justification for their development and compelling need for industry self-regulation. Specifically, even in well-developed and resource-rich countries like the United States, as noted by Fremont-Smith (2004), state governments sorely lack necessary economic, legal, and accounting resources for effective regulatory oversight. Nor has the federal government taken on a strong regulatory role. This effectively shifts the burden on industry and individual nonprofits to self-regulate.

For example, at industry level, Independent Sector (IS), the primary trade organization for NPs in the United States, strongly encourages self-regulation. Specifically, IS convened a national panel on the NP sector, which developed

33 Principles of Good Governance and Ethical Practice in 2007 and updated in 2015 (Independent Sector 2007, 2015), as shown in Table 1.

These 33 Principles of Good Governance and Ethical Practice are noteworthy for several reasons. First, their origin and impetus were due to the force of national government (White 2010). Specifically, US Senators Grassley and Baucus, on behalf of Senate Finance Committee, contacted Diana Aviv, then President of IS, expressing concerns that NPs were exploiting their tax exempt status and requesting IS to convene a national panel to develop recommendations to strengthen good governance, ethical conduct, and effective practice of public charities and private foundations (Corbett 2011). Given apparent risks of onerous legislation and regulation of the sector, IS agreed and convened a nationwide panel on the NP sector (IS Panel) to develop recommendations.

Secondly, the 33 Principles are highly noteworthy, if not unprecedented in their formulation, as they were developed over a multi-year period, involving many stakeholders nationally, including over 90 private foundations, community foundations, and nonprofits who contributed $3.5 million (Corbett 2011). These Principles were only created with the voluntary expenditure of great time, effort, and technical expertise, including legal and financial resources. These Principles reflect great progress on the learning curve and could substantially avoid or reduce costs otherwise incurred by NPs or NGOs cross-nationally duplicating such efforts.

Thirdly, the process employed is exemplary for its extensive cooperative and collaborative proceedings, involving hundreds of nonprofits and individuals in developing the IS Panel's recommendations (Independent Sector 2007). With such successful collaboration, the prospects and capacity for self-imposition are greatly improved.

Finally, in contrast to the 24 codes of conduct developed by state associations (Bromley and Orchard 2016), the 33 Principles are multi-jurisdictional due to the collaborative processes employed and consensus achieved by numerous, diverse parties. The Principles have demonstrated relevance and support from hundreds of stakeholders, across dozens of the states of the United States, as well as many foundations and charities operating internationally. Just as the 33 Principles have relevance and support across many states with differing legal frameworks, the Principles clearly have potential relevance to other states and jurisdictions across nation, regarding collaborative processes employed, substance of Principles, or both. Yet, this also recognizes that other jurisdictions with different legal and political frameworks, as well as values, must factor those in by relevant decision-makers.

## Improving Ethics and Accountability with Codes of Conduct: Translating Principles into Practice

### The Ultimate Challenge of Voluntary Codes of Conduct and Self-Regulation: Enforceability!

While many codes of conduct have been developed, including the dozens examined by Bromley and Orchard, there are inherent limitations in their use. Such codes often state what should be done, but not how to do it. Establishing a standard through consensus is difficult enough – figuring out how to solve the challenges of implementation is quite something else. Codes and principles are often aspired to, but often never implemented.

A widespread criticism of codes or principles is they are unlikely to affect behavior as they are unenforceable, as stated by Bromley and Orchard (2016). While such codes and principles are commonly unenforceable, they need not be so. Why? Code requirements or principles can be transformed and elevated to truly impact behavior, but it requires expenditure of significant further effort to address the challenges of implementation. Stated another way, this requires much effort translating principles into practice.

It is not that this cannot be done, but rather is most difficult. One must first identify and reconcile many challenges and then solve them with enforceable procedures incorporated into the NP's internal controls. Secondly, the goal is to forever alter the ethical environment or climate by incorporating systemic change permanently within the NP's *behavior setting*. As explained by Moos (1986), this refers to groups of individuals

**Accountability and Ethics in Nonprofit Organizations, Table 1** Summary of 33 principles of good governance and ethical practice – Independent Sector

| |
|---|
| Legal compliance and public disclosure |
| 1. A charitable organization must comply with all applicable federal laws and regulations, as well as applicable laws and regulations of the states and the local jurisdictions in which it is formed or operates. If the organization conducts programs outside the United States, it must also abide by applicable international laws, regulations, and conventions |
| 2. A charitable organization should formally adopt a written code of ethics with which all of its directors or trustees, staff, and volunteers are familiar and to which they adhere |
| 3. A charitable organization should adopt and implement policies and procedures to ensure that all conflicts of interest (real and potential), or the appearance thereof, within the organization and the governing board are appropriately managed through disclosure, recusal, or other means |
| 4. A charitable organization should establish and implement policies and procedures that enable individuals to come forward with information on illegal practices or violations of organizational policies. This "whistle-blower" policy should specify that the organization will not retaliate against, and will seek to protect the confidentiality of, individuals who make good-faith reports |
| 5. A charitable organization should establish and implement policies and procedures to protect and preserve the organization's important data, documents, and business records |
| 6. A charitable organization's board should ensure that the organization has adequate plans to protect its assets – its property, documents and data, financial and human resources, programmatic content and material, and its integrity and reputation – against damage or loss. The board should review regularly the organization's need for general liability and directors' and officers' liability insurance, as well as take other actions necessary to mitigate risks |
| 7. A charitable organization should make information about its operations, including its governance, finances, programs, and activities, widely available to the public. Charitable organizations also should consider making information available on the methods they use to evaluate the outcomes of their work and sharing the results of those evaluations |
| Effective governance |
| 8. A charitable organization must have a governing body that is responsible for reviewing and approving the organization's mission and strategic direction, annual budget and key financial transactions, compensation practices and policies, and fiscal and governance policies |
| 9. The board of a charitable organization should meet regularly enough to conduct its business and fulfill its duties |
| 10. The board of a charitable organization should establish its own size and structure and review these periodically. The board should have enough members to allow for full deliberation and diversity of thinking on governance and organizational matters. Except for the very small organizations, this generally means that the board should have at least five members |
| 11. The board of a charitable organization should include members with the diverse background (including, but not limited to, ethnicity, race, and gender perspectives), experience, and organizational and financial skills necessary to advance the organization's mission |
| 12. A substantial majority of the board of a public charity, usually meaning at least two-thirds of its members, should be independent. Independent members should not (1) be compensated by the organization as employees or independent contractors, (2) have their compensation determined by individuals who are compensated by the organization, (3) receive, directly or indirectly, material financial benefits from the organization except as a member of the charitable class served by the organization, or (4) be related to anyone described above (as a spouse, sibling, parent, or child) or reside with any person so described |
| 13. The board should hire, oversee, and annually evaluate the performance of the chief executive officer of the organization. It should conduct such an evaluation prior to any change in that officer's compensation, unless there is a multi-year contract in force or the change consists solely of routine adjustments for inflation or cost of living |
| 14. The board of a charitable organization that has paid staff should ensure that the positions of chief staff officer, board chair, and board treasurer are held by separate individuals. Organizations without paid staff should ensure that the positions of board chair and treasurer are held by separate individuals |
| 15. The board should establish an effective, systematic process for educating and communicating with board members to ensure they are aware of their legal and ethical responsibilities, are knowledgeable about the programs and activities of the organization, and can carry out their oversight functions effectively |
| 16. Board members should evaluate their performance as a group and as individuals no less frequently than every 3 years and should have clear procedures for removing board members who are unable to fulfill their responsibilities |
| 17. Governing boards should establish clear policies and procedures setting the length of terms and the number of consecutive terms a board member may serve |

(continued)

**Accountability and Ethics in Nonprofit Organizations, Table 1** (continued)

| |
|---|
| 18. The board should review organizational and governing instruments no less frequently than every 5 years |
| 19. The board should establish and review regularly the organization's mission and goals and should evaluate, no less frequently than every 5 years, the organization's programs, goals, and activities to be sure they advance its mission and make prudent use of its resources |
| 20. Board members are generally expected to serve without compensation, other than reimbursement for expenses incurred to fulfill their board-related duties. A charitable organization that provides compensation to its board members should use appropriate comparability data to determine the amount to be paid, document the decision, and provide full disclosure to anyone, upon request, of the amount and rationale for the compensation |
| Strong financial oversight |
| 21. A charitable organization must keep complete, current, and accurate financial records and ensure strong financial controls are in place. Its board should receive and review timely reports of the organization's financial activities and should have a qualified, independent financial expert audit or review these statements annually in a manner appropriate to the organization's size and scale of operations |
| 22. The board of a charitable organization must institute policies and procedures to ensure that the organization (and, if applicable, its subsidiaries) manages and invests its funds responsibly, in accordance with all legal requirements. The full board should review and approve the organization's annual budget and should monitor actual performance against the budget |
| 23. A charitable organization should not provide loans (or the equivalent, such as loan guarantees, purchasing or transferring ownership of a residence or office, or relieving a debt or lease obligation) to directors, officers, or trustees |
| 24. A charitable organization should spend a significant amount of its annual budget on programs that pursue its mission while ensuring that the organization has sufficient administrative and fundraising capacity to deliver those programs responsibly and effectively |
| 25. A charitable organization should establish clear, written policies for paying or reimbursing expenses incurred by anyone conducting business or traveling on behalf of the organization, including the types of expenses that can be paid for or reimbursed and the documentation required. Such policies should require that travel on behalf of the organization is to be undertaken cost-effectively |
| 26. A charitable organization should neither pay for nor reimburse travel expenditures for spouses, dependents, or others who are accompanying someone conducting business for the organization unless they, too, are conducting such business |
| Responsible fundraising |
| 27. Solicitation materials and other communications addressed to donors and the public must clearly identify the organization and be accurate and truthful |
| 28. Contributions must be used for purposes consistent with the donor's intent, whether as described in the relevant solicitation materials or as specifically directed by the donor |
| 29. A charitable organization must provide donors with specific acknowledgments of charitable contributions, in accordance with IRS requirements, as well as information to facilitate the donors' compliance with tax law requirements |
| 30. A charitable organization should adopt clear policies, based on its specific exempt purpose, to determine whether accepting a gift would compromise its ethics, financial circumstances, program focus, or other interests |
| 31. A charitable organization should provide appropriate training and supervision of the people soliciting funds on its behalf to ensure that they understand their responsibilities and applicable federal, state, and local laws and do not employ techniques that are coercive, intimidating, or intended to harass potential donors |
| 32. A charitable organization should not compensate internal or external fundraisers based on a commission or a percentage of the amount raised |
| 33. A charitable organization should respect the privacy of individual donors and, except where disclosure is required by law, should not sell or otherwise make available the names and contact information of its donors without providing them an opportunity at least once a year to opt out of the use of their names |

behaving together which has physical, behavioral, and temporal properties revealing complex interrelationships among its parts, such as including board and membership meetings of NP organizations. While board members will change, the need for a written ethical framework does not, which can then be revised and updated as conditions change, with consensus agreement by the board. This maintains an ethical framework within the behavior setting despite board turnover.

How do you translate principles into enforceable practices? Enabling enforcement requires a process or mechanism whereby compliance is monitored and failures result in consequences imposed by legitimate authorities. Specifically, this is done by shoring up lines of authority and responsibility; bolstering internal controls; and mandating reporting requirements and frequency, implemented through enforceable bylaws that require board action and approvals, while monitoring or, preferably, prohibiting conflicts of interest. This is accomplished through improved internal controls that assign reporting responsibilities through reporting requirements, on a periodic basis, to legally accountable authorities such as NP boards.

This process elevates principles into enforceable practices, as done for the 33 Principles of Good Governance and Ethical Practice (Corbett 2011). Specifically, the Principles are converted into bylaw form and rendered enforceable through reporting requirements imposed on specified parties, enabling ongoing monitoring of compliance and enforcement by the board. In each case, various "implementing authorities" are identified, who become accountable through bylaw requirement. That is, the 33 Principles were converted into 38 implementing bylaws, with 20 reporting requirements, including annual reports (10), semi-annual reports (1), quarterly reports (3), and periodic reports (6) based on reportable or triggering events. Such bylaws permanently change the behavior setting until altered by the board.

This method provides documentation necessary to assess internal compliance with board-approved governance principles and standards, enabling assignment of responsibility, or culpability, for governance failures. It also empowers board members to obtain key information in a timely manner, during the time frame when critical decisions are made.

### Translating Principles into Enforceable Practices: Three Illustrations

Following are three IS Principles, with the proposed bylaw and identification of implementing authorities (Corbett 2011; Note 1). The first illustration addresses the critical issue of *record protection* while ensuring timely access by board members to fulfill fiduciary duties.

**Principle 5** A charitable organization should establish and implement policies and procedures to protect and preserve the organization's important data, documents, and business records (Table 1).

Implementing Bylaws 5-A, 5-B, and 5-C (Corbett 2011, pp. 21–22):

> "**5-A**: Board members shall have general access and right to review all books, records, plant, and property for any proper purpose, at any reasonable time. Written requests for copies of records shall be made to the secretary and shall be provided within 30 days. This includes, but is not limited to, memoranda, financial reports, audits, expense records, itemized legal costs, and contracts.
>
> **5-B**: The books and records shall only be destroyed in accordance with a written record retention policy that describes the various records and required holding periods. [Insert Option]
>
> Option 1: The minimum holding period is 3 years. *(least aggressive)*
>
> Option 2: The minimum holding period is 4 years. *(recommended)*
>
> Option 3: The minimum holding period is 5 years. *(most aggressive)*
>
> **5-C**: The executive committee (if any) and president shall provide the record retention policy to the board for approval, disapproval, or modification, with a subsequent review every 6 months thereafter, providing a report to the board with recommendations for continuation or revision, for board approval, disapproval or modification.
>
> ***Implementing authority***: Records access officer, president, secretary, board of directors"

The second illustration addresses the many challenges of ensuring *board diversity.*

**Principle 11** The board of a charitable organization should include members with the diverse background (including, but not limited to, ethnicity, race, and gender perspectives), experience, and organizational and financial skills necessary to advance the organization's mission (Table 1).

Implementing Bylaws 11-A, 11-B, and 11-C (Corbett 2011, p. 35):

> "**11-A**: The NC (Nominating Committee or equivalent) shall evaluate and recommend candidates for the board and all committees. In evaluating candidates consideration shall be given to

(1) organizational needs, (2) board balance and diversity, (3) leadership ability, (4) availability to serve, and (5) other factors the board may specify, including financial literacy.

The NC, when submitting nominations, shall also report on the makeup of the board with respect to gender, race, and nationality. Diversity shall also be considered in staff recruitment, and the president shall report annually to the board on the makeup of the staff.

**11-B**: It is board policy that all members serve on at least one board committee, which the NC shall consider when qualifying and selecting candidates to most effectively meet board needs.

**11-C**: The board shall fill all vacancies caused by resignation, removal, or death of any officer, board member, or NC member upon recommendation of the NC. Any board vacancies caused by resignation, removal, death, or other reason and not filled by the board within 10 days may be filled by executive committee majority vote on an interim basis until the next annual or other special meeting.

***Implementing Authority***: Nomination committee, president, executive committee, board"

The third example addresses *board compensation* and is structured to provide multiple options for boards to consider in reaching consensus.

**Principle 20** Board members are generally expected to serve without compensation, other than reimbursement for expenses incurred to fulfill board-related duties. A charitable organization that provides compensation to its board members should use appropriate comparability data to determine the amount to be paid, document the decision, and provide full disclosure to anyone, upon request, of the amount and rationale for the compensation (Table 1).

Implementing Bylaw 20-A (Corbett 2011, p. 48):

"**20-A**: Compensation of board members, beyond reimbursement of reasonable expenses incurred in connection with board responsibilities, is prohibited. Exceptions to this provision must be supported by comparable data, with the level of compensation and rationale publicly available, upon request.

Option 1: Second, such compensation must be annually reviewed and approved by unanimous vote of the board. ***(recommended)***

Option 2: Second, such compensation must be annually reviewed and approved by a two-thirds vote of the board of directors. ***(aggressive)***

Option 3: Second, such compensation must be annually reviewed and approved by a majority vote of the board of directors. (***least aggressive***)

***Implementing Authority***: Board of directors"

## Conclusion

Improving ethics and accountability is highly complex yet clearly a most admirable and worthwhile goal. While many ethical values are subjective and vary based on political, social, cultural, religious, economic, and geographic factors, there are core ethics that widely apply. They include transparency, disclosure, avoiding conflicts of interest, and oversight (White 2010).

Regarding accountability, the concept of fiduciary duties is useful and widely applicable. They include the duty of care, duty of loyalty, and duty of obedience (Hopkins 2007; Rosenthal 2012). These four ethical values and three fiduciary duties provide a solid starting point for use by NPs and NGOs in developing ethical frameworks that best meet their organizational needs.

It is also apparent that improving ethics and accountability will require a process where stakeholders come together in a collaborative process to agree upon core ethics and accountability standards to which they will commit. Such an exemplary process, and successful blending of ethics and fiduciary duties, is as demonstrated by Independent Sector (Table 1).

Yet coming to agreement on ethical and accountability standards is necessary but not sufficient. That is, consensus-based standards or codes of conduct that are merely aspirational will not, by themselves, succeed. Real progress will require stakeholders to address, and rise to, *enforceability – the neglect of which is the Achilles heel of voluntary codes*. Enforceability can, however, be achieved by defining responsibility clearly, imposing periodic reporting requirements, monitoring and enabling compliance by those authorities legally responsible. This achieves accountability by bolstering often grossly inadequate internal controls. Such changes as these, implemented through the bylaws (Corbett 2011), modify the behavior setting (Moos 1986)

permanently improving the ethical environment. It also creates a consensus-based setting of integrity and trust, raising expectations of all board members and leadership regardless of turnover, unless and until changed by the board.

This is the essence of *organizational self-regulation* that is systematic and enforceable and is a proper, if not necessary, goal for all NPs and NGOs that seek autonomy and freedom to pursue mission, as well as those seeking to limit avoidable regulatory intrusion by government into nonprofit and sector affairs.

# Accountability and Governance in Fiji

Usman W. Chohan
UNSW Canberra, University of New South Wales, Canberra, Australia

## Synonyms

Development in Fiji; History of Fiji; Institutions in Fiji; Pacific Island development; Pacific Island institutions

## Definition

"Accountability and Governance" in Fiji refers to the extant and historic architecture in Fiji for the fostering of institutions that promote accountable development, oversight, and governance; in terms of their current capacities and challenges, in the influence of historical experience on their abilities, and in the degree of coordination between these institutions.

## Introduction

In Fiji, the objective of fostering more effective governance and accountability has been met with the need to reconcile a series of dichotomies, including those of centralization versus regionalism, of indigenous demography versus multiracialism, of Commonwealth (colonial) structures versus autochthonous structures, of military versus civilian bureaucracies, and of immediate governance requirements versus long-term planning (see Appana 2003; Nath 2006; Rika et al. 2008; Chohan and Jacobs 2016). The pendulum has swung periodically in favor of one element over the other since independence in 1970 (and even before), as evidenced in periods of military rule, or in several waves of exodus of Indo-Fijians, or in the process of power-centralization. As a result, while many accountability institutions and governance best practices are found in Fiji, their work can be described as disjointed and working in an uncoordinated manner (Chohan and Jacobs 2016). The purpose of this chapter is to delineate those elements and present an overarching portrait of their interaction in a Fijian context, and then to suggest areas of interest in governance reform as well as areas of future research.

## Overview of Fijian Accountability Institutions

Fiji is an independent republic in South Pacific that can be characterized as post-colonial, archipelagic, multilingual, biracial, primary-resource based, Commonwealth, and parliamentary. It exerts a substantial economic, political, and intellectual influence within the community of Pacific Island nations due to its comparatively large size, including a population base of nearly one million citizens (World Bank Databank [ŴBD] 2017).

After gaining independence in 1970, Fiji maintained numerous institutional legacies of the British colonial period, including a Westminster parliamentary system for representation, legislation, and oversight (Chohan and Jacobs 2016), as well as provincial councils for indigenous affairs (Rika et al. 2008). However, political instability led to coups d'état in 1987, 2000, and 2006, which then created periods of military rule that diminished the force of independent accountability institutions, and also sparked an exodus of Indo-Fijians who were highly active in these institutions, including in the parliament, the executive bureaucracy, the judicial system, and the audit office (Nath 2006). It also led to a centralization of power that fed tensions with the decentralizing forces that had sought to empower Fiji's rural population, which was 70% of the total population in 1960 and still accounts for 45% today (WBD 2017). Furthermore, the participation of civil society and the media in governance and accountability was markedly reduced in this period.

As such, the disruption caused by political instability and consequent regime changes has meant that, at one level, many accountability and governance institutions have not been able to deliver fully on their mandates due to their intermittent functionality (see Appana 2003; Nath 2006; Rika et al. 2008; Chohan and Jacobs 2016). At another level, it has also meant that, whenever these accountability institutions have been recreated, or have reasserted their role in the governance process, they have worked in a disjointed fashion that has not sufficiently coordinated their mutual purpose of fostering better governance (Chohan and Jacobs 2016).

## Accountability Institutions Today

In the past several years, the subjacent political tensions have eased, and this has allowed various types of reform to be instated at a large scale. Principal among these is the new *Constitution of the Republic of Fiji* [CoRF] that was promulgated with a view towards serious attention to transparency, accountability, and governance (Chohan and Jacobs 2016). The terms "accountability" and "transparency" appear numerous times in various parts of the constitution, and issues of accountability represent an entire chapter (among 12 chapters) within the constitutional document (CoRF 2013). In fact, Article 1,

Chapter 1 of the constitution begins by stating that Fiji is a republic founded of values of "good governance," "transparency," and "accountability," (CoRF 2013).

The constitution embodies a new impetus for accountability institutions to restart or re-enhance their work. Institutions of particular import include inter alia the Public Accounts Committee (PAC) of Parliament, the Audit Office, the Judiciary. The constitution also leads to inferences about greater room for addressing governance and accountability through civil society and through the media. There is today a greater emphasis being laid on public consultation in governance areas such as the budget process, where civil society and media groups are becoming more engaged.

However, despite its robust form and strong push for governance and accountability, the constitution does not encompass all of the institutional possibilities that would meaningfully serve Fiji. Chohan and Jacobs (2016) raise the example of a Parliamentary Budget Office (PBO), which is not explicitly mentioned in the constitution, as an institution that would bolster those entities that *are* mentioned in it. They argue that a PBO could serve a dual purpose. First, it could serve as a mechanism for budget accountability by introducing fiscal expertise that is nonpartisan into the budget process. Second, the PBO could help to coordinate the work of existing accountability institutions in the budget process, including the PAC and the Audit Office, which have historically worked on budget issues in a separate manner with only incidental or intermittent collaboration (Chohan and Jacobs 2016). This is not to be confused with their independent mandates, for coordination in this sense still implies that these accountability institutions will effectuate their duties independently, i.e., in collaboration but not in collusion, as part of the democratic process of oversight. The PBO is but one important suggestion, but future research must delineate other possibilities that are pertinent to Fiji. One example of this may be a *Citizen's Budget*, which seeks to simplify an understanding of the fiscal process for the general public so as to engage citizens more directly and broadly in national budgeting. Again, future research should consider which other governance institutions and mechanisms would best be suited to the Fijian context.

There are also a few institutional innovations mentioned in the 2013 Constitution that have yet to be put into effect. The most important among these is an *Accountability and Transparency Commission* (ATC). Article 121 of the constitution stipulates that the ATC will be an independent oversight commission that will work institutions such as Parliament. However, the constitution does not delve with specificity into the ATC's mandate, and since the ATC has not been created as of this writing, its future performance and success within the accountability architecture of Fiji is still indeterminate.

Fiji is engaged in a process of wide-ranging economic reform, including economic diversification away from its primary industries (notably sugar), the restructuring of several core state entities, prioritizing foreign investment, and developing Fiji's human capital. This reform process means that governance, along with its concomitant enhancement of the *democratic leverage* of citizens (Stapenhurst et al. 2008), is a matter of significance and immediacy.

## Conclusion

There are a series of dichotomies which have influenced the course of governance and accountability in Fiji. In terms of centralization versus regionalism, there is a larger degree of centralization today than in the past, which is influenced in part by events including political crises and military rule, but also because of demographic factors such as urbanization drawing citizens in from more remote parts of the archipelago. In terms of indigenization versus multiracialism, accountability and governance institutions reflect a concerted effort towards bringing racial harmony and leveraging the benefits of diversity for Fiji's institutions. In terms of its Commonwealth legacy, despite several episodes of expulsion since 1970, Fiji maintains many of the same accountability institutions found in the Commonwealth

**Accountability and Governance in Fiji, Table 1** Timeline of governance, politics, and accountability in Fiji

| Years | Events |
|---|---|
| Pre–1822 | Indigenous Fijians manage governance issues through societies founded on kinship ties that center around village life in settlements interspersed across the islands. Power is endowed to local chiefs who exercise independence and do not impose a centralized governance architecture |
| 1822 | European contact: Europeans arrive under auspices of missionary work and trade |
| 1853 | King of Fiji: Cakobau claims the titled of *Tui Viti* (King) |
| 1865 | Confederation of Fijian Chiefs established |
| 1871 | Constitutional monarch: King Cakobau adopts a symbolic role in constitutional monarchy, with legislature and cabinet dominated by settlers from Australia |
| 1874 | Fiji becomes a British colony |
| 1904 | Legislative Council reconstituted as a partially elected body, with European male settlers enfranchised and Fijian chiefs given an indirect input |
| 1929 | Partial enfranchisement of Indo-Fijians |
| 1963 | Indigenous Fijians enfranchised |
| 1967 | Responsible government introduced with devolution of power to Fiji |
| 1970 | Fiji gains independence from British rule |
| 1977 | Constitutional crisis in Fiji, with inability to form government post-election, governance and accountability institutions face headwinds |
| 1987 | Two military coups d'état, Fiji's expulsion from Commonwealth, Fiji becomes a republic |
| 1990 | New constitution institutionalizes a preeminent position for indigenous Fijians |
| 1990–1997 | Governance and accountability institutions suffer substantial shocks and adversity |
| 1997 | Constitutional conference leads to a new constitution that is generally accepted by leaders from major political parties |
| 2000 | Coup d'état and political crisis |
| 2000–2006 | Latent political, economic, and ethnic tensions continue to derail the work of governance and accountability institutions |
| 2006 | Coup d'état and political crisis |
| 2009 | The previous 2006 coup d'état declared illegal, restoration of the work of certain governance and accountability institutions quietly begins |
| 2013 | A new constitution (CoRF) is promulgated to replace the 1997 constitution. It lays an emphasis on accountability, reform, transparency, and governance |
| 2013–Present | Large-scale economic reforms are underway. Accountability and governance institutions begin a concerted effort towards exercising their mandates. However, in some instances, the process is not complete, and in some cases, while the process has successfully been reinstated, there is a lack of coordination with other accountability institutions |

community, such as Public Accounts Committees and a Supreme Audit Institution, and these are finding renewed participation in the accountability process since the promulgation of the 2013 Constitution. These are also part of the process of initiating a more longer-term approach towards governance processes such as budgeting. However, Fiji would benefit from several other institutions that are not yet in place, such as a Parliamentary Budget Office, a Citizen's Budget, and the Accountability and Transparency Commission that was mentioned in the 2013 Constitution but has not been put in place as of this writing.

As such, significant scope still exists for improving the standard of accountability in Fiji both at the national and subnational levels (Rika et al. 2008; Chohan and Jacobs 2016). The purpose in all of this should be to enhance the *democratic leverage* of Fijian citizens (Stapenhurst et al. 2008). Nevertheless, in light of the jagged and uneven path that Fiji has taken in the nearly 50 years since independence, the emphasis must not be on innovations in the accountability architecture, as much as it should be on (1) making existing institutions more robust and (2) on increasing the degree of coordination between them (Table 1).

# Accountability in Colombia

Carolina Isaza
Universidad Externado de Colombia, Bogota, Colombia

## Synonyms

Answerability; Control; Responsibility

## Definition

The relationship between an actor who delegates a task to another one and that one who has an obligation to explain his actions to the first. In a political context, accountability refers to the relationship between citizens and public officials, in particular, elected representatives in a democratic setting. This relationship implies responsibility, answerability, and transparency and is accompanied by institutional mechanisms that establish a relation of control.

Thus, accountability refers to an institutional design insuring that actors in a position of power, especially political actors, are forced to answer to citizens. The term is also applied to horizontal mechanisms of mutual control between the different State powers, also known as checks and balances or horizontal accountability.

## Introduction

Colombia has had a stable democracy despite the persistence of an armed conflict for 60 years, which is now coming to an end. The current Constitution dates from 1991. The country has a presidential system with checks and balances in place, at least formally. However, the Executive Branch is powerful, the bicameral Congress is weak and has the lowest levels of confidence from citizens (along with political parties), and the main source of real balance of power is the Judicial Branch, especially the High Courts.

Public administration in Colombia is a combination of Weberian style institutions and New Public Management reforms. However, strong elements of patronage, a spoils system and particularism remain, causing low trust in the State, low legitimacy, and weak political institutions.

In that sense, accountability in Colombia is situated between a strong and complex institutional design, combining mixed forms of accountability, and stronger informal institutions that challenge that same design and limit its practical performance.

The formal accountability institutions are reflected in the Constitution and the law. On 2010, an accountability policy was adopted by the Executive Branch, compelling public organizations to render accounts to citizens and publicize their actions and results (The document Conpes 3654, "Policy of accountability of the

executive branch to the citizens." The CONPES is a technical instance that approves public policies; it is a modified version of the Ministers' Council).

A particularity of the Colombian political system is the low accountability of the Legislative Branch towards citizens (voters). This can be explained by the patronage system, in which congressmen respond rather to particularistic clients than to citizens in general.

## Discourses on Accountability

Different actors in Colombia view accountability from various perspectives. Isaza identifies two main discourses on accountability in Colombia: a *managerial discourse* related to New Public Management which is instrumental in nature, and a *democratic discourse*, based on normative ideals about democracy and democratization of public administration (Isaza 2016).

Civil society, human rights, and democracy advocacy groups are in favor of a democratic discourse on accountability, based on citizen involvement in decision-making and participatory mechanisms. They prefer social accountability and a direct role of citizens in demanding change and overseeing government actions.

Public organizations in the executive branch and international organizations defend a more managerial discourse on accountability, related to NPM and performance management. The last two Colombian presidents are part of this tendency. Internal accountability mechanisms are preferred, including horizontal accountability and internal audits, controls and principal-agent style reporting.

The two perspectives have been combined in policy formulation and have shaped a particular vision of accountability in Colombia. The following sections present a description of existing accountability mechanisms, actors and forums, and discuss their efficacy.

## Mechanisms of Horizontal Accountability

Horizontal accountability is a concept developed by Guillermo O'Donnell to describe Latin American countries, where vertical accountability through elections and political parties has failed, and only checks and balances can guarantee that State actors remain accountable to someone (O'Donnell 2004). According to one definition: "Horizontal accountability exists when one state actor has the authority – formal or informal – to demand explanations or impose penalties on another" (Jenkings 2007).

Colombia is no exception to this characteristic. Presidentialism and a spoils system converge to make the Executive Branch the most powerful actor in the system, supported by political parties looking to gain some loot, i.e. public procurement contracts, government jobs and other benefits. Public administration is controlled by the President and central government via budget allocations.

There are mechanisms of internal accountability in place, going from subordinates in the bureaucracy to political appointees such as ministers, and from them to the President. Some of them have taken the form of manager-level performance contracts, such as the "Acuerdos de gestión"; others are part of the periodical evaluation of public servants and monitoring of public organizations' results channeled by the national program of public policy evaluation (Sinergia).

Therefore, Congress responds mainly to particular arrangements between parties and the president, and only occasionally to public opinion. This makes it unable to control the actions of the Executive Branch or demand accountability from it and even less able to impose sanctions. Even though the mechanisms that would allow Congress to sanction members of the Government exist in the Constitution (political control and censorship motions), they have rarely been proposed and never passed by any Congress (Isaza 2015).

In this context, the Judicial Branch and independent agencies remain the main accountability forum in Colombia. The so-called High Courts, i.e., the Constitutional Court and the State Council (Consejo de Estado) are the main source of controls and sanctions to executive power. This has led to a form of judicial activism in which the Constitutional Court forces the government via

sentences to comply with general mandates of the Constitution, assuming a role not only in agenda setting, but in public policy formulation, with important effects on national budgets.

On the other hand, Colombia, like other countries in the region, has created agencies of designated accountability. They are independent from direct control by the executive branch, although the election of their heads is not politically neutral. The main agencies of this kind are the General Auditor and the Comptroller General (Contraloría General), the Public Ministry, comprising the Procuraduría (in charge of disciplinary control), the national ombudsman (Defensoría del Pueblo), and local ombudspersons. The Electoral Council (Consejo Nacional Electoral) is also considered a horizontal accountability agency, as it controls political parties' behavior regarding financing and elections.

These agencies can sanction public servants for wrongdoing. Together with the judicial branch and its Prosecutor Office (Fiscalía General), they seem to be some of the few actors capable of making public officials accountable in Colombia.

## Transparency and Vertical Accountability

Traditionally, vertical accountability is understood as electoral accountability. That means citizens can vote out political actors who don't comply with promises or expected behavior. For this mechanism to work, reelection must be possible, or failing that, political parties should be strong, in order to allow for an indirect punishment of the incumbents by their party. Limitations of these mechanisms are well known (Stokes et al. 1999).

In Colombia, reelection of the president existed for over a decade but is no longer possible. In local governments, mayors and governors can run again for a nonconsecutive term. Neither of these mechanisms allows for political accountability of executive branch representatives. This means that the only remaining electoral mechanism for making local governments accountable is the recall (revocatoria de mandato). This figure allows citizens to call a vote to remove mayors or governors for not fulfilling electoral promises.

However, there are only a few cases where this has been accomplished, mainly because of high transaction costs and strict requisites, and the mechanism remains unfunctional for the purposes of political accountability.

On the other hand, both Congressmen and local corporations' members can be reelected indefinitely. This should introduce some electoral accountability regarding their roles, but the already mentioned limitations to this figure make this unlikely. Finally, accountability through political parties is also low, due to their fragmentation and inability to discipline their members.

Given this failure of electoral and political accountability mechanisms, the Colombian government designed an accountability policy in 2010, intended to force the national public administration to give periodic accounts to citizens. In this policy, the Spanish translation for accountability was used: rendición de cuentas or "to give accounts," understood mainly as a transparency measure including face to face exchanges of management information with citizens (Isaza 2016). As this is rather a transparency measure, the policy was later incorporated in the Transparency Law.

The outcomes of this initiative are mixed. On the one hand, it is clear that public sector organizations are now forced to be more transparent to the public and are getting used to give information and to talk directly with citizens about their performance, which is a positive development in itself. On the other hand, this does not necessarily translate into more accountability, especially given the above-mentioned deficits on the political front.

In sum, wrongdoing, corruption, and even inefficiencies are very likely to go unpunished by citizens, except by symbolic means discussed below.

## Social Accountability

Social accountability refers to the actions of civil society and citizens in general to demand

explanations and to sanction public servants and political actors. Peruzzotti and Smulovitz (2000) propose three types of social accountability in Latin America: through judicial mechanisms, through mobilization, and through the media.

Colombia has examples of the three (Isaza 2015). In the first place, several judicial mechanisms for social accountability are in place. The most successful are the civil rights guardianship (acción de tutela) and the right to demand public information from the State (derecho de petición de información). The first one allows citizens to invoke the State obligation to protect their basic civil and human rights. The second one guarantees fast access to public information. Finally, citizens can complain with the ombudsman and other horizontal accountability organizations and start or accompany investigations for misdemeanor or corruption.

The mobilization strategy in Colombia is used by NGOs and citizen overseers, the latter of which is protected by law. There is also the traditional channel of social protest and contestation. However, the country has a challenge related to the high level of social leaders' murders by illegal actors. This security situation implies that not many people are willing to confront the State on key issues.

The third social accountability strategy concerns the role of the media to denounce, call to account and symbolically sanction public officials for corruption and other wrongdoing. This strategy has a strong reputational impact and is very often the most successful of the three. Many corruption scandals in Colombia have been initiated by the press. However, just as with social leaders, journalists face risks when touching vested interests in Colombia, even the risk of death. The NGO Foundation for the Liberty of the Press reports between 117 and 336 annual violations to press freedom between 2006 and 2017.

## Corruption Control and Accountability

Colombia, like other Latinamerican countries, has intermediate levels of corruption, according to international measurements, such as Transparency International's ICP and the World Bank Governance Indicators. These levels remain relatively stable over time, questioning both the usefulness of such measurements and the efficacy of the so-called fight against corruption. According to the literature, since Klitgaard, accountability is supposed to be a key element of corruption control (Klitgaard 1988; Schatz 2013). In the Colombian case, the failures in the institutional design just described contribute to the persistence of corruption practices closely associated with the lack of adequate controls over political actors. Electoral, political, and grand corruptions are widespread.

A reason for optimism, however, is that the bigger cases eventually come to light, due to the elements of the accountability arrangement that are operational, i.e., both the media and the judicial branch. Scandals are reported periodically and sanctions eventually come to some of the responsible actors involved in corruption practices.

The downside of this publicity of corruption cases is an increasing loss of legitimacy and confidence that leads to general disappointment with politics and government, as suggested by Bauhr and Grimes (2014). A shown by diverse opinion surveys, Colombians increasingly perceive that corruption is pervasive and systemic and feel little confidence of this changing in the near future.

## Conclusion

Accountability in Colombia faces serious challenges. The legal framework is complex and contains all types of accountability mechanisms: vertical, horizontal, internal, and social. In practice, only the judicial branch and judicial channels for citizen complaint are doing the job of controlling, calling to account and sanctioning public servants and political actors who fail in their duty. Despite failures and even corruption scandals involving the courts, they have been able in the past to perform an accountability function that other actors, including citizens, are unable or unwilling to perform. The media comes as a second-best accountability forum, despite challenges to freedom of the press.

The Executive Branch has made important efforts to make public administration more accountable, including an official policy and legal provisions to compel organizations and public servants to have better communication channels with citizens. These measures are partially effective to democratize public administration but do not serve to make political actors and high officers more accountable.

The main risk for the country regarding this issue is political accountability. Political parties have managed to avoid most efforts to increase accountability and have an important role to play in Congress lack of it. The patronage practices, State captures, and institutional weaknesses related to them impede accountability measures to function properly. In consequence, Congress is unable or uninterested in being accountable to citizens and cannot demand accountability from the Executive Branch, which makes it the weakest link in the institutional design.

This failed institutional design causes corruption to remain high, whereas it is successful to bring some grand corruption cases to trials and convictions, but this in turn causes a general image of pervasive and incontrollable corruption, affecting citizen morale.

# Accountability in Federal Government

Jonathan Rauh
College of Charleston, MPA Program, Charleston, SC, USA

## Synonyms

Answerability; Honesty; Integrity; Liability; Respect

## Definition

The oversight of federal programs and operations by elected authority to ensure the business of government, and those undertaking the business of government, are answerable to the American people.

## Introduction

A major challenge to accountability in the federal government is politics. That statement may seem

a bit tongue-in-cheek, but it is the balance of political power with policy objectives that makes strong accountability regimes so difficult to implement. Politics and governance are two separate endeavors that are intimately intertwined. The latter consists of addressing the functional aspects of governing society that make modern life livable. The former consists of building brand image and gaining votes. The role of accountability in governance and in politics is thereby also intertwined – public disclosure of efforts to advance policies that help one set of interests at the expense of another even if done via directions to the bureaucracy can have engender negative reactions for those opposed to such policies or practices while those in favor of such policies will certainly advocate for them. The use of governance as a tool for advancing political agendas has made accountability in the federal government a difficult endeavor and one for which structural and incentive-based arguments do not have good answers.

In discussing accountability, it is important to first define terms. Accountability simply refers to the ability to call someone to account for their actions (Lerner and Tetlock 1999). Discussions of accountability are a combination of structural, rational, and behavioral arguments seeking to describe the amalgam of relationships between elected and public officials as well as mid- to low-level functionaries. Structural arguments proceed from a discussion of Executive appointment authority combined with discussions of the Legislature's ex post or ex ante use of the budget as a tool to enforce policy priorities. Rational arguments proceed from a discussion of how the policy priorities of the Executive and legislators can be achieved via shifting the incentive structures for bureaucrats. Finally, the behavioral arguments address the microlevel interactions of individual bureaucrats within an accountability regime, i.e., how do they respond to the political machinations put upon by elected officials seeking to use structure and incentives to achieve their policy priorities? This entry will provide a commentary on how politics at the federal level works to affect accountability regimes and will also provide some discussion of the results in the two most recent administrations. This is a topic that could, and has, filled volumes, for example, Balla and Gormley (2017), so this commentary will in no way be exhaustive.

## A (Very) Brief Overview of Accountability and Delegation

In the process of studying how elected officials attempt to satisfy their policy priorities we tend to see shifting of authority and representation from elected political authority to the federal bureaucracy. This is in one part practical and in one part political. The practical side is explained well in *Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc.* (1984). It is arguably one of the most important administrative law cases of the past 50 years, establishing what is commonly referred to as *Chevron deference*. This refers to deference granted to agencies to interpret statutes in which congress was not explicit about what they intended. Such deference is premised on the idea that an ambiguous statute is in fact implicit delegation (*FDA v Brown & Williamson* 2000). The practical meaning of this is the standard refrain that most MPA students receive about the power of bureaucrats to interpret policy. After all, in the USA as in other democracies, there is a tacit delegation of policy-making authority and responsibility to bureaucracy simply for practical reasons. First, Congress does not have the capacity to address the day-to-day work of addressing all the issues that actually make modern life livable. Second, it is probably advisable that Congress not engage in such activities simply for safety and functionality – do we want non-environmental chemists telling us what should count as safe levels of Benzene in the potable water? But what does this say for accountability – democratic, legal, or otherwise?

While many conservative members of Congress deride the level of authority granted to the bureaucracy (Balla and Gormley 2017), the permissive authority that Congress tends to grant to agencies belies any actual efforts to reign in the bureaucracy. By way of example, Webb-Yackee and Webb-Yackee (2016) clearly

demonstrate a higher degree of permissiveness in regulatory authority granted to an agency – allowing an agency to regulate or not. Birkland (2016) is more explicit in his views of the deference Congress grants to the bureaucracy, noting that delegation is often part of a procedural strategy that is necessary to address politically difficult issues. Put simply Congress passes off authority to the bureaucracy so that if the bureaucracy does well at implementing their policy priorities then Congress (or individual congressmen) can claim credit for being wise enough to trust the experts; if things go poorly though then there is a ready made scapegoat in the form of the bureaucracy.

The above demonstrates two separate, and flawed, notions of accountability in the federal government. Legal accountability provides sufficient oversight to the extent that the courts view the bureaucracy's interpretation as unreasonable. Beyond Congress being explicit in its crafting statutes or courts forcing an agency to provide a more reasonable interpretation of an ambiguous statute, accountability moves into the political realm. It is already known that elected officials use bureaucratic authority as a crutch for difficult political decisions and tend to provide oversight via administrative action (submitting annual reports and providing updates to congress). Stronger actions such as public reviews of agency actions leading to more explicit instructions tend to only occur following a crisis – what McCubbins and Schwartz (1984) refer to as fire alarms. What we are left with in very general terms is a system in which political expedience incentivizes delegation to bureaucratic agencies and in which the limits of those agencies is de facto limited by the extent to which their interpretation of ambiguous directions are seen as reasonable.

### What About Transparency?

There is more internalized (within the bureaucracy) but less formally regarded means of accountability available to ensure the public can know what its government is doing (note that this does not imply they will know to whom to assign credit or blame). This is the process of ensuring transparency in procedure and meetings – something that is easier in principle than in practice. As used here, transparency is referring to transparency of process as opposed to open disclosure such as that called for by former head of the Office of Government Ethics, Walter Shaub – his recommendations were more specifically in line with politics, corruption, and individual interests as opposed transparency in the process of governing.

When the Affordable Care Act was making its way through, Congress President Obama promised to have the negotiations between the White House and Congress aired live on CNN – in keeping with his campaign promise of a transparent administration. This did not happen of course and Conservative critics were quick to point out the lack of transparency. There is another question here though – would it have even mattered?

It is difficult to know ex ante whether being open and transparent in a process would have provided a different outcome. It is also far too easy to point to transparency as the cure all for a flawed process. The relationship between interest groups, the bureaucracy, and elected officials means that seeking accountability via a transparent process can equally predict both the success and the failure of a proposed piece of legislation depending upon the relative strength of the players involved and whether they see an explicitly strong benefit for transparency. For example, it is difficult to imagine that insurance companies would want to have a fully transparent airing of negotiations with regulators over their loss ratios (the amount they must in services to covered individuals). This is not because insurance companies are necessarily ill-intended, rather because the average American likely thinks that insurance markets function like product markets and therefore do not understand insurance very well to begin with. By this same token policy discussions around things that Americans tend to understand – such as K12 education – may benefit from greater transparency. The point is that one cannot simply point to a transparent process as a sufficient condition for either good policy or good accountability (Krotoszynski 2011).

This lack of sufficiency extends beyond the process of making laws and is seen in how

agencies apply their own transparency policies and how the public responds to those policies. Piotrowski (2008) showed that agencies have very different views on whether freedom of information was a central part of their mission as do citizens. While the Securities and Exchange Commission may view freedom of information as one of its core functions, the department of education does not (Piotrowski 2008). A great irony in the process though is that more heavily politicized agencies may take freedom of information more seriously, but they also tend to be the slowest to respond to FOIA requests (Wood and Lewis 2017). If both agencies and the public have differential concern as to the role of transparency, then it implies that those agencies who both have low concern for transparency and for whom the public has a low concern for transparency are by default less accountable. This brings us back to the fire alarms argument (McCubbins and Schwartz 1984). Although the presence of standards for transparency is in theory equally applied, this does not make the practice of applying those standards equal. It is only when some malfeasance comes to the fore that the process of accountability really kicks in for agencies with low concerns for transparency.

As an example of this, consider the failings of the Department of Education with regard to estimating the true costs to borrowers of student loans. The Obama Education Department (ED) sought to force more and more borrowers into Income Drive Repayment plans (IDRs) (Pasquale 2015). This pushed the number of borrowers on IDR from 10% to 24% from 2013 to 2016 and increasing the number of loans in IDR from 20% to 40%. By law, ED is required to provide an annual estimate of the long-term subsidy cost of the federal student loan program (the amount of the loans currently in effect less the net present value of the total repayment over the life of the loan). Unfortunately, in ED's 2016 report, it underestimated the amount of the subsidy by almost $11 Billion. According to a Government Accountability Office review of why ED's estimate was so far off was that ED's model assumed no growth in the number of IDR borrowers despite policies implemented to drive more borrowers into IDR.

## Accountability Is a Process, Not an Instance

If anyone asks for one single solution on how to make government more accountable, they will be disappointed because no single solution exists. There are several solutions from both a policy and a practice perspective that could make accountability both of elected officials and agencies more robust. To increase accountability, one must first go back to what accountability is and then think about what they want accountability to be. From Lerner and Tetlock (1999), we see that accountability is simply the ability to call someone to account for their actions. This makes no expectations of the outcomes of calling someone to account. Senator Robert Menendez was called to account for his actions. He was accused of bribery and federal corruption, tried and the case was dismissed. The Senate Ethics Committee (following the dismissal) stated that it would reopen its inquiry into Menendez. How much of this is partisan and how much is fact-finding is uncertain though.

Likewise, when the Education Department grossly under-calculated the actual costs to borrowers of student loans, the GAO investigated and ED was called to account. The high profile failure of several Veterans' Affairs hospitals and even the investigation into Russian collusion by President Trump's campaign – all have been called to account. If the question is simply one of the ability to call one to account, then the system is working although we may not like the outcomes of the process. It is that process of calling to account that is perhaps the most pressing issue. Accountability in the federal government is not seen as robust (Tolchin and Tolchin 2015; Basinger 2013). This is not because high level public and elected officials are not called to account though; it is because they are and it does not seem to matter. This means that when one thinks about accountability in the federal government, it would be beneficial to think about the process of

holding people to account and not just accountability as a concept.

If accountability is a process, then it is helpful to think of it in terms of rule of law as opposed to a regulatory enforcement action. As a concept, this may be difficult since the rule of law often delves into issues of democratic theory and the rights and duties of citizenship – this is not really helpful in thinking about how to better enforce accountability since, on principle, Americans already believe in the majority of the premises necessary for rule of law. What is needed is a positive definition.

First, accountability systems must accept, as do common law and criminal law, that the rules themselves are subject to rules. This means that no actor can, on a whim or because of their position, enforce one rule as nullifying or being more important than another unless it is explicitly stated as such. This also means that the inability to pick and choose the rules one wishes to be applied more stringently is not up to any given individual but must be stated in the rules themselves. This means that clarity of rules in both intent and empowerment are a necessity. Legal theorists often point to lists of what facets good law should have in order to be clear, predicable, enforceable, and specific (O'Donnell 2004; Raz 1980). The legal positivist scholar Joseph Raz points to eight characteristics that laws should have including being prospective, open and clear, unbiased, made in the open in clear and stable manners, and so on. Among the eight characteristics though, and most pertinent here, is that discretion should not be allowed to pervert the law – a point that refers to enforcement agencies and the courts but which is pertinent for thinking about accountability since it is enforced via institutions.

The enforcement of accountability takes on different forms though. Vertical (electoral) accountability is probably the one with which people are most familiar. The examples above and make it clear though that vertical accountability can be manipulated by manipulating the governance process. Horizontal (societal) accountability has requirements that are not often met within the US population or US institutions. There is not a vigorous self-assertive society in America demanding equal application of accountability standards. By contrast, Lau et al. (2008) show clearly that what the public believes counts as corruption or "just politics" depends on whether the actions stem from one's own party. In the ideal standard of horizontal accountability, no one regardless of position should escape legal or regulatory oversight regarding the legality or compliance of their actions. Finally, it must be the case that like cases are treated alike regardless of the class or position of the individual or institution in question. These requirements do not get the argument for accountability beyond the current state though since all of these facets can be seen in the application of accountability currently. This implies that if one wishes for equality in treatment regarding accountability then the current applications of the rules regarding accountability and the current accountability rules themselves are flawed.

In terms of the rules themselves one can explain what low-level functionaries tend to bear the brunt of the rule for accountability violations, intentional or simply as mistakes, by the fact that they cannot mount a stout legal defense (Lewis and Gilman 2012). The discretionary and often overly lenient or severe application of accountability rules demonstrates flaws in the application of rules. Finally, there are flaws in how rules relate to ordinary citizens, individuals in power, and enforcement bodies that demonstrate systemic rather than individual weaknesses. A case in point for this would be Secretary Tom Price's 2017 defense against charges of insider trading. On the same day, then-Congressman Price's stockbroker purchased $90,000 worth of stock in six pharmaceutical companies, Price arranged calls seeking to roll back rules that would hinder the performance of the pharmaceutical industry (Faturechi 2017). If a city official had attempted a similar act for something like a concrete company and a road contract, then they would have likely been imprisoned for official corruption. Under the current rules, for Congressmen (and the law under the STOCK act), Price's actions are defensible. Sections 4 and 5 of the STOCK act lay out the rules under which members of congress are to

operate with regard to knowledge they gain as a result of their positions, e.g., §4(g)(1):

> [E]ach Member of Congress or employee of Congress owes a duty arising from a relationship of trust and confidence to the Congress, the United States Government, and the citizens of the United States with respect to material, nonpublic information derived from such person's position as a Member of Congress or employee of Congress or gained from the performance of such person's official responsibilities.

While the circumstantial evidence certainly implies that Price likely knew of the purchase, no record of a conversation between Price and his broker has been found that would establish that as fact. A more problematic issue is the construction of the statute. Stockbrokers are not idiots nor do they behave as though their clients are random actors. Price's political reputation and position on healthcare regulation were well known and the rulemaking process was public so the fact that these rules would have been up for review was also known. With that information alone Price's stockbroker could intuit what Price would do when the rules came up for review.

Although it looks bad, it does not create a situation of corruption prima facie, but because only a select few individuals get to hold authority under which such a defense could be used the application of such a rule to practices of insider trading in general would be problematic if not impossible. If, for example there were a rule that when the federal government purchased certain regulated commodities that they must do so at a percentage of the prices set by an index compiled from specific companies, then there would be an incentive for Congressmen on the committee regulating those commodities to purchase stock in the companies that make up the index. Of course, anyone savvy investor could do this, but because of their oversight capacity and ability to influence regulators, the congressmen on the committee could purchase stock in anticipation of regulatory activity that only they are privy to. Examples of this are seen in the purchase of chicken which is set by the Poultry Dock Index produced by the Georgia Department of Agriculture based on inputs from poultry producers (Dewey 2018). The ability to use information in this way creates a clear conflict of interest and a loophole that has yet to be addressed.

## Conclusion

There are clearly instances in which the rules for accountability available to powerful elected officials are not the same as those for functional bureaucrats. Additionally, there are instances in which the review process for determining accountability is lacking in understanding. What can be done though? Working from the examples and requirements stated herein, there are some suggestions for reform that could make the federal government more accountable.

Most of the challenges discussed herein exist because of politics. It is difficult therefore to think of ready solutions to these challenges that would not incentivize even greater subterfuge. If we were to publicize all negotiations and openly publish the schedules of elected officials, then we would likely see an increase in ex parte lobbying in which case it would even more difficult to know why rules are being crafted in a specific manner. If we were to require that an agency provide all communications from its employees, agency heads, and contractors, then the cost of computing power for storing the information would run into the multiple millions if not billions of dollars. Although I do not have a ready made set of solutions for incentivizing better accountability, incentives towards better accountability is just what is necessary.

Politics is about power and influence, i.e., an incentive-based structure premised on the capacity to act on those incentives towards some end. A tightening of process rules is unlikely to provide much in the way of better accountability and is likely to have the opposite effect. Instead what is needed is a means of providing incentives that create a situation where good behavior is incentivized more heavily than the rewards that could be offered through bad behavior. These must be crafted an applied in such a way that no one could enjoy benefits or avoid punishments simply as a result of their position.

# Accountability in the Judicial Administration of Bangladesh

Abdur Rahman (Zibol)
The Supreme Court of Bangladesh & Former Additional Chief Metropolitan Magistrate of Bangladesh Judicial Service, Dhaka, Bangladesh

## Synonyms

Answerability; Chargeability and Blameworthiness; Culpability; Liability; Responsibility

## Definition

Accountability in the judicial administration endorses the meaning to have sound judicial remedies in getting justice at large or judicial accountability in specific with a view to establishing good governance in all the spheres of the state.

## Introduction

The existence of accountability in a democratic country is based on the rule of law which is the patent expectation of every citizen. Judiciary assumes the supreme constitutional responsibility to ensure accountability in the governance system in the state that demands independence of judiciary as well as responsible judiciary. All aspects of judiciary ought to be highly accountable as the

accountable judiciary is the parameter of all organs of the state to come into an accountable character. Lack of accountability generates dysfunctions, transparency crisis, and corruption and destroys the fundamental rights resulting in injustice everywhere. The accountability in judiciary depends on many factors like the legal framework, institutional arrangements, procedures, and methods as well as the persons involved including likely judges, staff, advocates, police, doctors, government executives, and litigant persons in the dispensation of justice. Moreover there is a serious moral and ethical issue involved in judicial accountability. Especially the judges, the heart of judiciary, have to be independent and impartial subject to their ethics. Lack of fairness in judicial activities by the judges caused by several factors coupled with the undesirable political intervention encourages other organs of the state to do everything deliberately which causes injuries to the people at large. Lack of accountability in the judiciary paves the way to these injuries.

Problems of accountability in judicial administration now have emerged as a national crisis in Bangladesh. This crisis has a multiplier impact in a negative manner on public and social governance. There should be a thorough research study on the present judiciary in general and judicial accountability in specific with a view to establishing good governance in all the spheres of life in the country. In the modern atmosphere, the emerging legitimate expectation has come with a call for accountability of all public institutions largely upon the judiciary as the judges have tremendous power as they can review both legislature and executive branch's decisions and the instant issue has got a philosophy of knowledge. An accountable and transparent judicial administration can ensure the safeguard of exercising the human rights and make other institutions of the state accountable in their own business. Accordingly a colossal reform is indispensable in the judicial administration of Bangladesh.

## What Is Meant by "Accountability"?

Accountability guarantees responsibility, and the same breeds transparency in judicial administration. The impression of accountability in judiciary of a democratic country is based on the rule of law that all aspects of judiciary ought to be highly accountable as the accountable judiciary shall be the parameter of all organs of the state to come into an accountable character.

Accountability and transparency closely bear a similar character of fairness, whereas corruption leads to an opposite character to each other. Accountability of judiciary may be to the conscience, to the law, to the legislature, to the executive, or to the public at large which can establish a civil society. On the other hand, corruption decays the fundamental rights which establish injustice everywhere. The accountability and transparency in judicial administration depend upon the involving person likely judges, staff, advocates, police, doctors, executives relating with the land administration, and litigant persons in the dispensation of justice. The judges have to play a vital role in the dispensation of justice as the other persons are accountable to them by their respective activities with the process of delivering a judicial process.

## To Whom Are Individual Judges and the Judiciary Accountable?

The most and foremost considerations are that the individual judges are to be accountable to their conscience and the judiciary to people at large. However the following forms of accountability are to be considered:

(i) Accountability to the enforcement of law, equity, and justice.
(ii) Internal accountability to senior judges or courts by way of (a) the system of appeals against judicial decisions and (b) procedures for dealing with complaints about the conduct of judges.
(iii) External accountability to the public by way of amenability to scrutiny in particular by the media but more widely by civil society.
(iv) Accountability to the executive branch of the state (through the Supreme Judicial Council).
(v) Accountability to the legislative branch of the state.

These forms of accountability have common characteristics. For instance, the appeal and complaint processes provide both internal accountability and accountability to the public, and the giving of evidence to legislative committees provides direct accountability to Parliament and indirect accountability to the public.

## For What Should Individual Judges and the Judiciary as an Institution be Accountable?

The extensive meaning and perceptions now given to the term "accountability" are attuned with the independence of individual judges and the judiciary; the question takes place as to what these are and for what the judiciary should be accountable.

In answering this question, the following values are to be considered:

(a) The characteristics of accountability depend upon the responsibilities and conduct of the individual or the group.
(b) The fundamental importance of the independence of individual judges and the judiciary as a body.
(c) The individual judges and the judiciary as a body should not be subject to forms of accountability prejudicing their core responsibility.
(d) There should have an environment of sharing responsibilities with the judiciary and executive in respect to the responsibility of the judiciary for the deployment of individual judges, the allocation of work within the courts, and the well-being, training, and guidance of serving judges, which mean that the judiciary is responsible for:
    (i) Ethical practice for establishing rule of law and justice.
    (ii) An effective judicial system, including the correction of errors.
    (iii) Training of judges in the light of changes in law and practice.
    (iv) Identifying and dealing with core problems, equality, and health as well as safety issues concerning serving judges.

The judiciary and executive share responsibility for the provision of complaints and disciplinary system to identify and deal with issues of competence, misconduct, and personal integrity.

## Analyzing Principles and Identification of Problems

This is a common proposition that one cannot properly be made accountable for that for which one is not responsible. Bangladesh judiciary assumed judicial independence in the name of separation of judiciary from the executive through Masdar Hossain Case, 1999, and a Judicial Service Commission has been established in 2007; it is the commission and not the executive which is responsible for and therefore accountable for appointments of judges, and it is the executive (the government) who is responsible for and therefore accountable for providing resources for the courts and the judiciary.

Judicial independence and existence are not unconditional perceptions, and there are many formulations of it. However, prime requirements which are that the judiciary must be impartial that its decisions are accepted, that it is free from any kind of influence or biasness, and that it has jurisdiction, directly or by way of review in respect to the overall issues of a justifiable nature and by which it is capable of rendering justice on all issues of significant legal and constitutional importance.

A new concept of judicial governance and administrative responsibility has been emerged in the modern state which mostly depends upon the independence of judiciary. Judicial independence means that judges are not subject to pressure and improper influence and are free to make impartial decisions based solely on facts and laws. It is embodied in statute in the judicial oath and runs through legal training, judicial culture, and judicial education. It ensures that judges are not subject to political pressure and the dictates of the legislature (Parliament), or public pressure, or that of individual interest groups.

So, judicial independence from the executive and the legislature is an essential part of

democracy and rule of law. It ensures that power is not held in one entity, so reducing the risk of tyranny, and it provides assurance of impartial hearings. Independence for judges at an individual level means that no judge is accountable to another for any judicial decision that they make; they are held to account instead through the appeals process. Judges are also given immunity from prosecution for any acts they carry out in the performance of their judicial function.

As per the provisions of the Constitution of the People's Republic of Bangladesh, the executive, legislative, and judicial branches of the state should show appropriate respect, oblige, and aid for the different positions occupied by the other branches. The limits of what it is proper for judges to say to the media, or in lectures, follow from the need to safeguard the core constitutional responsibility of the judiciary. The consequence should be that government's ministers, members of Parliament, and the media should also respect the need to safeguard and to avoid prejudicing or oxidizing this core responsibility. That should limit what it is appropriate to say to or about judges and individual decisions maintaining the standard of share responsibility.

In Bangladesh there is no separate acted code of conduct for the judges. The structure of the system including the appellate process and the process for making complaints about the conduct of judges is determined by general statute and regulation and, in the case of complaints and discipline, first handled by an internal authority. The appropriate forms of accountability are thus in part identified by those instruments. There is no definite mechanism to endow information about court process, delays, workloads, training, appeals, complaints, lack of integrity and misconduct, and equality issues to Parliament, and the public is an appropriate way of explaining, justifying, and opening these areas to public examination and scrutiny. It should identify the boundary between the respective responsibilities of the judiciary and of the executive (for resourcing the courts, i.e., for providing court buildings, court staff and logistic support, etc.). The sharing responsibility of the judiciary is not incompatible with the requirements of judicial independence.

### The Accountability of Individual Judges

It is the wise saying that not only what the judges do but also what the judges do not do, for which judges are accountable. The judges shall be the trustee of confidence relating to fair justice of the public at large. Judges being human are charged with the responsibility of protecting the human rights and freedom of the citizen, and they are custodians to keeping the trust of people by their judicial performance. The measurement of judicial accountability shall depend upon the individual high character, knowledge, and commitment to the rule of law of the judges, and the judicial activism shall be reflected in the administration of judiciary by their impartiality, integrity, competence, and diligence, as well as ensuring equality of treatment to all before the courts in discharging performance of the judicial office.

## Accountability to the Executive of the State

Under the provisions of the Constitution of the People's Republic of Bangladesh, judges of the High Court and the Court of Appeals are appointed by the president taking consultation with the prime minister (i.e., head of the executive) and shall hold the post till attaining 67 years of age unless otherwise disqualified. This protection was given to protect judges against the power of the executive. These judges are oath bound to be impartial for ensuring justice, and thus they are not individually accountable to the executive in their capacity as such in either the "sacrificial" or the "explanatory" senses. It goes without saying that safeguards on their tenure are a vital part of the independence of the judiciary. That is not to say that the executive has no role to play in the consideration of complaints and disciplinary proceedings made against judges. As per Article 49 of the Constitution of the People's Republic of Bangladesh, the president has assumed power of pardon and grants a stay of execution of any decision of the court, and on the other hand, the president has to take consultation to the prime minister for exercising the said power as per Article 48 of the Constitution. Moreover, the

executive has been given the power to transfer and promote judicial officers in substantive consultation with the Supreme Court of Bangladesh as per Article 116 of the Constitution. Such accountability, however, depends upon the check and balance between the judiciary and executive.

## Accountability to the Legislative Branch of the State

The parliament has supreme power to pass any act for the removal of the judges of the Supreme Court, i.e., the ultimate form of accountability. It has been exercised by the Parliament through the Sixteenth Amendment of the Constitution of the People's Republic of Bangladesh. Thus the Supreme Court of Bangladesh recently declared the said Amendment ultra vires to the Constitution as the said Amendment curtailed the supremacy and independence of the Judiciary. However, the Parliament has power subject to a rule ("the sub judice rule") to make a discussion of ongoing cases, the decisions, and conduct of individual judges by way of debates in the House. Parliament is accountable to the common people, and its debates make judiciary accountable to the people at large. This, however, does not mean that judges are accountable to Parliament for their decisions in particular cases, save insofar as Parliament may legislate to reverse the effect of a decision. Accountability for their decisions is incompatible with judges' necessary independence. Individual judges may also not be invited to give evidence to Parliamentary Committees. In modern times a manifest tendency is considered that all the branches of the state are trying to break the principle of check and balance.

## Internal Accountability of the Judiciary

Internal accountabilities mean in the sense that the decisions of the judges are subject to appeal and some judges are responsible for the allocation of cases to other, individual judges are accountable to senior judges, or judges holding positions of higher responsibility. Long traditions and adopted rules for the conduct of judges provided guidance on matters such as impartiality, integrity, competence and diligence, personal relationships and perceived bias, and activities inside/outside the court.

The responsibilities of the head of division and presiding judges, and judges in charge of a particular jurisdiction, are designed to assist in the effective management of judicial work. They have to apply common sense to exercise with due regard to the importance of the need to respect the independence of individual judges in relation to the decisions before them. This means that they cannot dictate another judge on how to decide a case. The judge in authority must design to ensure that cases are heard by an appropriate judge and the available judiciary is fully and effectively deployed within the resources provided by the executive branch of the state. It is to be observed, however, that one of the guarantees of independence is that judges must be free from outside instructions, improper influences, or pressure from other members of the court or the judiciary.

## Accountability to the Public

The public has ample opportunity to scrutiny of the work of individual judge's accountability through formal processes of court proceedings. As a general rule, court proceedings and the decisions of judges are to be declared in public. The decisions of judges must be rational and justifiable and are subject to comment, by the media and other commentators. The quality of individual decisions in respect to errors in law and facts is also subject to control in the form of appeal to higher courts. These identification and correction of errors by appellate courts are also public and reasoned.

## The Limits of these Forms of Accountability and Practices

The limits are on what a judge may properly deal with the removal of his office. In fact the High Court judges and above can only be removed by the Supreme Judicial Council as per rules. Other

judges can be removed by the president in consultation with the Supreme Court for incapacity or misconduct pursuant to statutory powers.

Judges are also absolutely immune from personal civil liability in respect to any judicial act done in the bonafide exercise of their office as a judge of that court as per the provisions of the Judicial Officer's Protection Act (1850).

The reason for a judge's immunity from civil suit is to make and to be able to do his duty with dignity and complete independence and free from fear. It is not because the judge has any privilege to make mistakes or to do wrong. The appeal and review system deals with such matter, and the criminal courts deal with criminal wrongdoing.

### The Institutional Accountability of the Judiciary

There are patent relations between the features of individual accountability and the question of institutional accountability to ensure good governance in the state. It is significant to distinguish the accountability of the judiciary as an institution from that of the courts as an institution. This is because of the responsibility of the executive for the resourcing of the courts. For example, if a lack of resources means there are insufficient courts, court staff, or judges and the result of this is a delay, it is the executive and not the judiciary who is responsible and accountable.

The responsibility of the judicial administration for the deployment of judges, training, handling advocates, taking complaints and disciplinary system, and the provision of an effective judicial system within the resources provided means that it is legitimate for there to be some form of accountability in the stream of these matters. In respect to those matters on which the judiciary's share responsibility with the executive, it is legitimate for there to be a measure of "explanatory" accountability by the judiciary.

## Accountability to the Executive Branch of the State

One of the endeavors of the executive is to ensure good governance partly by the judiciary. Thus the reasons precluding the accountability of individual judges to the executive apply equally to institutional accountability. In the light of the peril to judicial independence of direct accountability to the executive, it would appear that the primary forms of accountability must be either to the legislature or to the public in the sense that the system is made open to and subjected to scrutiny by civil society.

## Accountability to the Legislative Branch of the State

Accountability to the legislative branch is firmly a matter of control rather than accountability. It should carefully consider whether the judge can answer questions about matters concerning the administration of justice which fall outside their area of judicial responsibility or previous responsibility. The boundaries of legitimate questioning reflect the need to protect the independence and impartiality of the judiciary. The Parliament can curtail or reduce the power of the courts as per the provisions of the constitution that does mean the accountability is primarily to Parliament but indirectly it is also to the public.

## Accountability to the Public and Amenity to Scrutiny by Civil Society

There are some accountabilities discussed above which can be seen as an indirect form of accountability to the public at large. This is so in the case of the formal processes of court proceedings and the appellate process. These enable scrutiny of the outcomes of cases and comments by the press, interested parties, and commentators. In addition, there are also the debates of Parliamentary Committees as to the judiciary on occasions where this is truly necessary and appropriate.

***Interviews and media briefings:*** The giving of interviews by the concerned lawyer of a particular case and subjecting oneself to questions by representatives of the press and other media are certainly a form of accountability. From time to time, the Chief Justice of Bangladesh, the holder of that

office, has given occasional interviews and media briefings at the time of judicial conference/training conducted by the members of the judiciary.

***The judiciary's website:*** There are many information about the judiciary that are now available to the public on the judiciary's website (www.supremecourtbd.com). It has assisted in explaining and opening up the work of judges to public scrutiny. There are sections on "About the Judiciary," containing sections inter alia on "roles and types of jurisdiction," "daily cause lists," "appointment circular, complaints and appeals," "cases search," and "judicial pronouncement." The focus of the site is on accessibility and on matters which are considered to be of interest to the public.

***Annual reports:*** The annual reports on the operation of particular jurisdictions and the report that the Chief Justice makes to the president and more unswerving form of accountability to the public.

The court reports and *judicial statistics* provide a statistical analysis of the work and waiting times based on the figures provided by the Supreme Court. Many of them discuss significant developments and assessments of the proposition of development. The reports are valuable tools for external scrutiny of the structure and are thus potentially another and more express form of accountability to the public for the administration of justice.

## Loopholes of Judicial Administration

There are some limitations of resolving the problems in respect to accountability likely political interference and indulgence, appointments of the persons involving with judicial activities, absence of specific code of conduct of the judges and staff of the court, and lack of ethical practice by the advocates.

Over and above, there are many loopholes in the administration of judiciary in Bangladesh. The judges (include magistrates) are literally independent, but constitutionally they are not independent at all. Nowadays, the lack of confidence to have justice has emerged to the mind of the people toward the judiciary of Bangladesh, and the reality comes true from the outcomes of the judiciary. Apparently the reasons behind the injustices from the judiciary are as follows:

(i) Political interference
(ii) Lack of ethics and morality of the judges
(iii) Ignorance of judges
(iv) Nepotism of the judges
(v) Delay in delivering judgment
(vi) Lack of opportunities to lead a sound life
(vii) Phenomena of bribing leading to a hyper life

## Administrative Lacunas Are as Follows

(a) Appointment
(b) Posting and transfer
(c) Internal interference
(d) Misuse of an annual confidential report
(e) Mismanagement of cases
(f) Improper management of staff
(g) Time management
(h) Case log
(i) Lack of mechanism to identify false cases
(j) Lack of staff
(k) Lack of logistics relating to conducting courts
(l) Staff must be of another district

## Other Tribulations

1. Lack of ethics in the profession of the advocacy
2. Inquisitiveness to file and lodge false cases
3. Skeletal inquiry and investigation by the police
4. Emerging of the middle class in dealing cases
5. Ignorance of the law of the people at large

## Expectation of People to the Judiciary

The people always expect an impartial, transparent, and accountable judiciary likely opposite to corrupt judicial administration. The margins of legitimate questioning reflect the need to shield the independence and impartiality of the judiciary. Nowadays, the question of accountability and

transparency as well as corruption in judicial administration has emerged as a national crisis. In the modern atmosphere, the emerging legitimate expectation has come with a call for accountability of all public institutions largely upon the judiciary as the judges have tremendous power as they can review both legislature and executive branch decisions, and as such the judiciary shall be free from any interference, be it political or otherwise. In November 2017 Chief Justice Surendra Kumar Sinha has been removed from the post by dint of political interference through the executives for which the Supreme Court Bar Association is holding protest programs for 2 months. Moreover, the executives sometimes improperly exercise power in respect to appointing Appellate Division's judges and Chief Justice of Bangladesh by superseding the senior judges which is also a threat to the independence of judiciary.

## Suggested Remedial Measures

One injustice creates another injustice. In our judicial system from ancient to modern, it is obvious that accountability and transparency have decayed gradually turning it expeditiously into the modern stage. Independence of judiciary not only institutionally but also mentally of judges is the prime barrier to reach into a sound judicial system. Political atmosphere plays a vital role in the judicial administration for all the periods of ruling the state. The pre-British period marked out to Hindu and Mughal administration developed a continuous historical process, and thereafter the British period brought a tremendous change in the judicial system which mixed up with the Hindu and Muslim personal laws and customs. In all periods there was a distinctive legal system though they brought changes through various settlements and judicial reforms. Finally after independence a cut-and-paste legal system of India and Pakistan has been adopted in Bangladesh. In outlining the structure of the courts, it can be easily guessed that evaluations have occurred in the judicial system by changing the name of courts, by changing the power of courts, and moreover by creating new courts in all periods. Day-by-day corruptions have increased in the judicial administration which is a major barrier for establishing an accountable and transparent judicial system in Bangladesh.

The judiciary of Bangladesh has been running through a legal framework from the Commonwealth Law systems. The Constitution of the People's Republic of Bangladesh has established an independent judicial process for establishing the rule of law in the country. In our country the adversarial judicial system is prevalent through the alternative dispute resolution (ADR, including negotiation, mediation, and arbitration) has been adopted in civil jurisdiction to create a win-win situation toward the parties in which practice has not been developed among the people. It is very much essential to adopt ADR system in some sorts of criminal cases to reduce the caseload from the courts.

The digital judicial system should be introduced in aid to the present system such as all the people must be informative of the day-to-day judicial work of the judges, staff, and police as well as advocates involving with their respective cases. The deposition of the witnesses and arguments of the advocates must be recorded and have a printed version. The decisions of the courts must be available on the categorized website of the judiciary. There shall be special facilities for all the dealing persons of the case for 15 years of plan to introduce a new digital judicial system.

Moreover, there are inherent problems with any justice system regardless of reforms, such as problems of evidence quality, and conflicting principles of justice in complex situations, where any solution may deem illogical. Many serious problems can be solved by well-proven methods of reforms to improve the quality of justice. Judges and lawyers must be strictly monitored for compliance with the guidelines for judgment, and their financial and all other transactions are reported and monitored for corrupt influence. Citizens must be enabled to conduct actions without a lawyer by procedures ensuring that the best professional advice is available and no action should be dismissed without judgment on the merits. Appeals of any judgment including findings of fact should be allowed at

least twice with judges of distinct legal philosophy, with or without new evidence or legal theory. In addition, the personnel of the judiciary, lawyers, and the instructors and administrators of law schools must be thoroughly cleansed. Most are just the wrong people with the wrong motives to perform these functions. They have selected their careers and have caused these problems for personal gain and have mastered skills which would enable them to ruin any reform and to restore their corrupt aristocracy. Their complete removal and replacement, regardless of the delays involved, would not cause significant injustice in comparison with the existing system in operation. The reforms are also required for legal education and judge selection process. The Appellate Division should be divided into Civil and Criminal Appellate Division, and the Chief Justice of Bangladesh should not have judicial power except administrative power over the whole judiciary. If these reforms are done well, the judicial branch could begin to serve the people rendering substantial justice.

Every action must have a definite conclusion. Earlier stated loopholes must come into a tolerable situation to eradicate corruptions and also to establish a sound and independent judicial administration.

## Conclusion

The judges and magistrates are the trustees of ensuring justice for all at large. The last hope of the people keeps before the judiciary, and legitimate public criticism of judicial performance is a means of ensuring accountability. An accountable and transparent judicial administration can ensure the safeguard of exercising the human rights of each and every human being, and the individual judges are subject to a strong system of internal accountability in respect to legal errors and personal conduct, but outside the judiciary, these are often not understood in terms of accountability. However, the other institutions of the state must be accountable in their own business, and the judiciary can also play its part by tailoring a sense of accountability in its officers by adopting substantial judicial reforms.

# Accountability in Tourism Governance

Michelle Scobie
Institute of International Relations, Sir Arthur Lewis Institute for Social and Economic Studies, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Environmental stewardship; Good governance; SIDS

## Definition

Accountability in environmental governance is the obligation of persons or organizations whose activities may have or have an environmental impact to report to those actors that have a right to regulate, adjudicate, and penalize those actions that may be harmful to the environment.

## Introduction

The international tourism industry and, more specifically, the international cruise shipping industry are a good example of a sector with complex accountability relationships. Caribbean cruise tourism is a global vertically integrated industry: cruise lines are owned by private corporations that manage their operations across multiple jurisdictions, linking tour operators, cruises, visitors, flag states, and the port states of the US and Caribbean destinations. Each of the actors is answerable to the states wherein they operate, to their clients and patrons directly, to third party agencies that monitor and report on environmental activity, and to international bodies that regulate shipping. Caribbean states that have tourism as their main source of national income depend on cruise lines and air carriers to bring tourists to their shores. Cruise lines are answerable to flag and port states for their environmental activities and impacts under international law. Lines have threatened to bypass islands that attempt to introduce onerous requirements. How can cruise lines be held environmentally accountable in power asymmetrical relationships with small states? This entry explains the concept of accountability in environmental governance and how a powerful global industry like cruise tourism is environmentally accountable to states, international institutions, industry associations, and to a lesser extent to private certifiers under international law.

## Environmental Governance and Accountability

Environmental governance refers to the ways in which states, international and regional institutions, treaty secretariats, government agencies, and a wide range of state and non-state actors (including multinational corporations, the science community, nongovernmental organizations, private national corporations, community-based organizations, certification and standard agencies) at global to local levels purposefully steer and shape human actions that impact both positively and negatively upon the natural and built environment. The rules and standards of environmental governance come from international environmental law, from environmental principles, and from the principles of good governance. International environmental law is enshrined in treaties and in internationally recognized environmental principles incorporated into international and national law, such as the polluter pays, the precautionary, and the common but differentiated responsibility principles. Good governance refers to the quality of the governance processes within institutions and among actors in a given sector and includes values such as transparency, participation, equity, effectiveness, efficiency, and accountability. Goal 12.6 of the new United Nations Sustainable Development Goals, an agenda which will guide the UN's activities until 2030, encourages companies, "especially large and transnational companies, to adopt sustainable practices and to integrate sustainability information into their reporting cycle."

Accountability makes an actor, or group of actors, responsible for carrying out a task answerable to others for that exercise. An actor is accountable when he has a duty to report to others and where his decisions, actions, and the values that motivate him are driven by stated or unstated norms developed through direct or informal arrangements (Biermann and Gupta 2011) with the agent to whom he should report. Traditionally, in electoral or tribal systems of authority, accountability was related to systems of representation and to the duty to report to those in whose name an actor was exercising the task of government. Today, environmental governance is multimodal (a wide range of networked actors and institutions outside of the state) and multilevel (from global to local scales). Many more actors are involved in accountability relationships than in the past.

Accountability in environmental governance is operationalized through accountability relationships that may be internal or external to the agency in question (Keohane 2003). Accountability in governance has four key components (Biermann and Gupta 2011). First, the duty and right to

establish environmental reporting relationships, as where, for example, port states, require ship log data on emissions and waste disposal procedures from ships at their ports. Second, the duty and right to establish rules, standards, and guidelines on environmental behavior, for example, states pass national laws to control port emissions and in international organizations such as the International Maritime Organization, establish standards to control vessel-sourced pollution. Third, the duty and right to judge environmental behavior is done by the port authorities of flag and port states, shipping certification agencies, and environmental NGOs. Finally, the duty and right to establish penalties for failure to keep to environmental standards is enforced through national legislation of port and flag states. Accountability requires transparency and regular monitoring and reporting: accountable actors should inform others of their activities. Port and flag states are the main actors that hold cruise lines to account, but independent agencies are also part of the accountability nexus. The global tourism awards scheme, for example, recognizes best practice by industry actors. Many of the Caribbean cruise lines are part of the Cruise Lines International Association (CLIA) that encourages inter alia voluntary environmental accounting and reporting.

The following sections address the importance of tourism and cruise tourism for many Caribbean islands, the types of actors in the accountability relationships, and how they are operationalized.

## Caribbean Cruise Tourism

The Caribbean is the closest destination to the USA which is the largest source for global tourism market, and cruise tourism is an important part of the industry for the islands. According to the Cruise Lines International Association since the end of the transatlantic passenger industry in the 1950s, the Caribbean dominates global cruise tourism with over 50% of the market share (CLIA 2014). Tourism accounts for four times as many jobs (13%) in some Caribbean islands when compared with the global average (3.4%) (World and Tourism 2016, 1) and up to 10 times more for total exports (73% in St. Lucia and 5–6% for the global mean). Caribbean states dependent on tourism are increasing incentives to cruise industry actors and invest heavily in enabling infrastructure such as deeper ports and port facilities to accommodate industry trends for larger vessels (Korbee et al. 2015).

Small size has generally been linked to limited state power and capability (Simpson 2006; Cooper and Shaw 2009), and there are power asymmetries in the cruise tourism sector between the state and cruise lines (Tejada et al. 2011). The latter can unilaterally choose which ports to visit, dictate terms of engagement on itineraries, and create competition between ports to ensure maximum commercial gain. SIDS are not unaware of the environmental, economic, and societal impacts of the industry (Macpherson 2008) nor of the limited revenue from cruise ship arrivals but will not deter the industry. Commodity chain approaches are helpful to explain how profits do not remain on the islands but on board cruise lines that provide an inclusive package to guests making spending onshore unnecessary (Clancy 2008; Wise 1999). In Barbados cruise tourists spend less than 100 USD in an onshore visit which may last between 3 and 8 h as compared to land-based tourists that spend on average 1100 USD per stay which may stretch from several days to several weeks (Pinnock 2014).

The scale of the environmental impact of the industry is still being documented (Bonilla-Priego et al. 2014). Port infrastructure, ship operations, and cruise terminals disturb, damage, and pollute marine ecosystems (Korbee et al. 2015); antifouling surfaces on ship hulls can pollute waters and destroy marine organisms (Klein 2011); ships require special systems for garbage disposal to avoid pollution from sewage, solid matter, and hazardous substances especially where no port reception facilities are available to handle waste disposal (Johnson 2002) and there is always the risk of illegal disposal of these substances; there is also a risk of pollution from oil emissions and of air pollution in coastal areas and at ports (Blasco et al. 2014), and ballast water discharge may transfer invasive species to vulnerable ecosystems.

## Environmental Accountability Relationships in Cruise Tourism

Environmental accountability in this sector has two principal levels, the international and the national. At the international level, cruise lines are accountable to two main groups – to international organizations related to shipping (especially the International Maritime Organization) and on a voluntary basis to private actors (such as certification agencies and environmental NGOs). At the national scale, cruise ships are accountable to flag and port states.

Under international law, flag states are the states in which ships are registered. These states determine the nationality of the ships (Article 91 of the United Nations Convention on the Law of the Sea – UNCLOS) and are responsible for monitoring and enforcing inter alia international and domestic shipping law, regulations, and environmental standards (Article 94). The EU, the Bahamas, Italy, Panama, and 57 flag states have ships that trade in the Caribbean region (MOU 2016). The International Maritime Organization (IMO) is the source of many multilateral environmental agreements related to shipping and has been custodian of the marine environment since 1954 when the International Convention for the Prevention of Pollution of the Sea by Oil (OILPOL Convention) was accorded. The 1973 International Convention for the Prevention of Pollution from Ships (MARPOL) governs marine pollution from oil, chemicals, other harmful substances, garbage, sewage, and air pollution and emissions. The 1975 Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (the London Convention) governs the control of pollution of marine spaces by dumping. The Oil Pollution Preparedness, Response and Co-operation Convention (OPRC Convention and its 2000 OPRC-HNS Protocol), the Anti-fouling Systems Convention, the Ballast Water Management Convention (to prevent of the spread of invasive harmful aquatic organisms carried by ships' ballast water), and the Hong Kong International Convention for the Safe and Environmentally Sound Recycling of Ships (Hong Kong Convention) are environmental treaties administered or managed through the IMO. Since January 2016, all IMO member states are applying the Member State Audit Scheme (IMSAS) to ensure homogenous implementation of the International Management Code for the Safe Operation of Ships and for Pollution Prevention.

The Caribbean marine governance legal architecture and governance framework (Scobie 2012) is the Convention for the Protection and Development of the Marine Environment in the Wider Caribbean Region or Cartagena Convention and its protocols for Oil Spills, Land-Based Sources of Pollution, and Specially Protected Areas and Wildlife for the Wider Caribbean.

At the national level, cruise ships have varying levels of environmental responsibility to port state agencies, local tour and transport operators, owners and managers of cruise terminals, ship and tourist service providers, and community groups (London and Lohmann 2014), but strict obligations are only those enforceable by national law through the port state control agencies.

Port State Control is the inspection of foreign ships in national ports. Under Part V UNCLOS, ships are subject to the jurisdiction of the port state when they enter their waters, and these states have exclusive jurisdiction to protect and preserve the marine environment for up to 200 nautical miles from their low-water shorelines. Port states through their protective services and customs and border protection agencies inspect and review ships and issue safety certification prior to the ship's sailing. These agencies enforce international and domestic laws and have the authority to detain ships for serious violations. In 1998, Caribbean states signed a Memorandum of Understanding on Port State Control (CMOU). To date 16 states participate in regional efforts to inspect foreign ships in their ports to verify compliance of the ship and equipment with international law. The goal of the CMOU is to eliminate the operation of substandard ships in the region.

Private, non-state agencies assess, report, certify, and award actors within the tourism sector on environmental performance, but cruise lines are not strictly speaking accountable to them. The

Caribbean cruise industry has varying degrees of relationships with these actors. Certification agencies set standards, rules, and guidelines relating to ship design and operation based on the IMO's specifications. They offer inspection and certification services on behalf of flag states, port states, insurers, and other industry stakeholders and thus enter into accountability relationships with cruise lines. The largest ship certifier is Lloyd's Register that has its own Environmental Protection Rules for the control of Operational Pollution. A growing sector of private international tourism watchdogs draws attention to what they deem as breaches of acceptable environmental standards. They include the Ethical Traveller, Friends of the Earth, Responsible Vacation, Cruise Law News, the Business and Human Rights Resource Center, and Tourism Concern. The Green Tourism Awards and the Responsible Travel Awards are annual awards that highlight best practices in cruise shipping but have little power over the industry. There is no evidence that their reviews determine industry environmental practices.

How does internal and external accountability work in cruise tourism in the Caribbean?

There is some degree of internal accountability in the industry. The Caribbean cruise market is dominated by few companies, a consequence of the industry's consolidation in the recent past. The main industry associations are the Florida Caribbean Cruise Association (FCCA) and the Cruise Lines International Association (CLIA). The Royal Caribbean Cruise, the Carnival Cruise Line, and the Norwegian Cruise Line are main lines that operate in the Caribbean waters. Their operational and management objectives include environmental responsibility, and they publish (albeit not regular) reports on their environmental operations. The Cruise Lines International Association established the Cruise Forward Organisation to report on the industry's sustainability and safety and to promote members' compliance with international regulatory requirements and best practices. CLIA member cruise lines have a zero-discharge policy for sewage, a standard higher than the international requirement which allows for discharge of treated sewage. CLIA promotes the use of technologies to improve air quality, such as using exhaust gas scrubbers and diesel electric engines, using onshore-based power and variable ship speeds. CLIA members must comply with MARPOL and an International Safety Management Code that provides for monitoring and auditing of environmentally related activities.

External to the industry, NGOs and conservation groups' lobby for standards for sewage treatment and air pollution that are higher than the minimum are established by international law. The CLIA reports that their members keep to higher standards although they have not in the past held themselves answerable to environmental NGOs. In 2014 and 2016 for example, the cruise industry refused Friends of the Earth International group of conservation organizations' (FOE) request for further information on environmental practices. While industry reports via annual reports on an annual basis, the accountability relationships of industry are with states and official ship certification agencies. Limited data is available on industry's environmental performance from independent sources. The FOE publishes a Cruise Ship Report Card (FOE 2016) on ship performance in two areas with potential environmental impact: sewage treatment and air pollution reduction. The Caribbean cruise lines generally performed better than ships visiting other regions despite the earlier discussed power asymmetries because under international law, cruise ships must be surveyed and certified by officers of the flag state, recognized organizations, recognized security organizations, or nominated surveyors and this certification provides another layer of accountability for Caribbean cruise ships. The certificates are governed by the IMO Harmonised System of Survey and Certification and confirm that the ships are designed, constructed, maintained, and managed in compliance with the IMO's conventions, codes, instruments, and resolutions.

Cruise lines that visit the Caribbean have the USA as a close port state that has jurisdiction and capacity to impose, monitor, and enforce environmental standards on cruise lines. The US Coast Guard, the US Centers for Disease Control and Prevention, the US Environmental Protection

Agency, and the US Customs and Border Protection agencies conduct scheduled and unannounced inspections on cruise ships in US ports. US waters since 2010 fall within the IMO's Emission Control Areas which provide for greater, even more stringent air pollution standards. The US Government has a good record of inspection and enforcement of international and domestic law on all ships entering or leaving US ports. The Royal Caribbean Cruises Ltd. was convicted in 1998 and 1999 and charged USD 27 million in criminal penalties after a coast guard surveillance operation filmed one of its vessels, the Sovereign of the Seas, and then the largest cruise ship in the world, discharging oil via a secret bypass pipe on its way to Puerto Rico (DOJ 1999).

The islands that are part of the Caribbean Memorandum of Understanding of Port States (CMOU) also exercise port state jurisdiction. They inspected 867 ships in 2015, 392 had deficiencies, 2047 deficiencies were recorded, and 89 related to environmental issues under MARPOL and 18 ships were detained: seven in Jamaica, seven in the Netherlands, three in French overseas territories, and one in Antigua and Barbuda. Ninety of the ships inspected were passenger ships; 42 of them had deficiencies but none serious enough to warrant detention (MOU 2016).

## Conclusion

Accountability for environmental activity and impacts in the cruise ship sector in the Caribbean includes both internal industry-driven measures and external accountability. Context influences the way companies apply corporate social responsibility in firm governance (Young and Thyil 2014), and small and less well-resourced or less powerful states in many contexts are able to leverage international systems to their advantage (Browning 2006). The cruise lines are strictly accountable under international law to flag and port states. The Caribbean cruises are subject to strict and well-resourced surveillance from the US Port Control agencies. Since 1996 the Caribbean Port Control agencies through the CMOU have also been working together to strengthen surveillance and secure compliance of all ships in their ports with international law. Caribbean Lines are also accountable to industry associations such as the CLIA, although the reporting on performance is not transparent and available to independent agencies. The case of accountability in cruise ship governance is a good example of how SIDS leverage their geographical position (close to a state with environmentally stringent marine environmental laws) and the international legal framework of IMO requirements to their advantage.

## Synonyms

Answerability; Attributiveness; Performance judgment; Responsibility; Transparency

## Accountability in Scope

Being accountable means that one is called to account for one's actions. It sounds quite simple, but any analysis must understand the context of the actions and the authority by which the person acts. If one is in a position of authority, then in a well-functioning or ethical society that authority carries a responsibility – a responsibility to act in the interests of those who confer that authority and a responsibility to be transparent in exercising that authority.

This may well be the ideal, and we are all aware of breaches that have taken place in specific contexts. In a political context, politicians may behave without accountability when they are driven by avarice or corruption or by a narrow ideological focus and so will serve only the interests of a selected few. If they are held to account, voters will not return them to power. If they are not accountable, then the voters or citizens have no say, and their opinions and wishes do not count.

In a business sense, accountability would cover good practice and prudent governance in serving the interests of shareholders, customers, employees, and other stakeholders. Performance (not just financial performance) is scrutinized by stakeholders, including corporate and other regulators who monitor workplace safety, industrial conditions, etc. Technical information such as accounting standards, performance measurement (KPIs), and consumer satisfaction indicates levels of accountability. There have been well-known examples of businesses behaving without accountability, such as Enron in the USA and some Wall Street companies during the 2008–2009 global financial crisis, though news media continually bring new examples.

In professional life one expects that practitioners who use their formidable skills to ensure the well-being of their clients do so in an accountable manner. Often the details of what the professionals do, the research upon which this is based, and the special knowledge that is acquired over time are all a mystery to the client, but the client can expect that the professional will be accountable for ethical practice. We see examples

occasionally of doctors, accountants, and lawyers who do not always act in the best interest of their clients, and they are dealt with by their professional bodies, who determine whether standards of accountability have been breached.

In this entry the focus will be only on public sector accountability and its implications for public policy.

There are three basic questions that analysts and practitioners should ask:

- Who is accountable?
- To whom is one accountable?
- For what is one accountable?

In the sphere of public policy, there are two types of accountability. There is accountability in the **making** of policy and there is accountability in the **implementation** of policy. In the USA, the separation of powers limits the making of policy to the legislature, and the implementation of policy to the executive, though this is often blurred. In most other political systems, there is a lot of overlap between the development and the implementation of policy, and very often the same personnel are involved in both. This conceptual distinction is important as it has a significant impact on the mechanisms of control.

In all of our policy making and implementation, each actor is responsible to one another. The loop of total responsibility may be large or it may be small, but everybody is required to account for their decisions and actions. The lowest bureaucratic officer is required to account to his/her supervisor. The head of government in a parliamentary system is required to account to the legislature, the head of state, and the voters. In the USA, the head of government is also the head of state, and a system of checks and balances structures that accountability, and if there are deemed-to-be breaches that cannot wait until the next electoral cycle, then there is an impeachment process.

In a way this is the distinction between external accountability and internal accountability. External accountability is the accountability to those for shaping the direction and the big picture and strategic orientation of a government, while internal accountability is that for ensuring that the policy objectives are being implemented and met, that things are done in a proper way, and that the processes are appropriate.

In public administration, it is often said that there are two challenges – doing the right thing and doing things right.

We live in a regulatory state where, in contrast to earlier periods, governments are less concerned with the direct provision of infrastructure and services and more concerned with the oversight of that provision by others and the regulation of processes to achieve the strategic or societal outcome.

Colin Scott (2000) makes the point that accountability can be:

- Upward, to a higher authority
- Horizontal, to a parallel authority
- Downward, to lower-level institutions and groups

In public administration, there is accountability for three things:

- Money
- Process
- Outcomes

One could therefore draw up a nine-cell matrix of direction and content (upward, horizontal, downward by money, process, outcome). For example, upward accountability for money by a government agency would be that acquittals for the budget (as legislated by the parliament) are presented again to the parliament to demonstrate what has been done with the appropriation. Horizontally, an agency would submit its finances for inspection to the audit office and, in its negotiation for more funds, to the treasury. Downward, it would provide information to its stakeholders and consumers of its services in the way of information sheets, progress reports, and annual reports. Similarly, the other cells can be filled in.

## Tools and Processes

Alnoor Ebrahim (2003) distinguishes tools and processes. Tools, he says, are devices and

techniques that are stable over time and tangible, such as financial reports and disclosures which can be documented and repeated each month, quarter or year, or standardized KPI measurements. These differ from process methods such as participation and stakeholder relations which might reflect a state of action rather than a specific end result, but processes are in no way a lesser measure of accountability. Ebrahim (2003) discusses five types of accountability that relate to nonprofit organizations that deal with governments, and here they can be adapted to be used as four mechanisms of accountability in public administration.

First there are reports and disclosure statements. Most agencies have a requirement that they must report to a variety of other partners or bodies, ranging from superior authorities to stakeholders. These are usually reports on finances, programs, structures, processes, and outcomes. Sometimes they are legally mandated and must occur with a specified frequency and in a specified format. At other times they appear when it is expedient or suitable.

Second there are performance assessments and evaluations. These might take the form of measures of key performance indicators (KPIs) or evaluations. The evaluations can be internal or externally conducted and could be process evaluations (is the program on the right track?) or summative evaluations (did the program achieve what it was meant to achieve?).

Third there is the participation that is fostered and the relationships with stakeholders. Governments are often criticized for being remote, out of touch, or lacking transparency. Fostering participation is more a process than a tool. It may involve providing information and consultation with decision makers and could involve any of a number of processes. These processes might involve consultation, building bridges to stakeholders, seeking views on problem identification, various types of collaboration and co-production, collaboration in the development of policy options, and ultimately implementation, which may involve co-regulation. The greater the accountability through participation, the greater the risk, for not all interests can be accommodated, and if stakeholders are deeply involved and things do not turn out as they wished, then they could accuse the government of the lack of accountability.

Fourth there is self-regulation. It is common for organizations to have codes of conduct and codes of ethics. Sometimes these have come about in response to a scandal and sometimes as a means of broadening accountability by showing that the agency is committed to doing the right thing. There is always the issue of enforcement of the code, for if enforcement is lax, the code has little value. As well as enforcement, the legitimacy of the code reflects the way in which it came into being. Being handed down from on high rarely gives a code traction or enforcement efficacy. If there is participatory negotiation in its development, then it will have wider ownership and credibility, and if there is regular reporting on compliance assessment and breaches, all the more so.

In essence there is an agreement on key principles and ethical positions. A code of conduct and a code of ethics are separate documents. An ethical code incorporates the values of the organization and in so doing assists members in understanding the difference between acceptable and unacceptable, or more bluntly between right and wrong. A written code identifies principles and standards that conform to organizational values and is often a document expressed in abstract concepts. A code of conduct is more precise and prescriptive. It is often written in compliance terms and sets out rules of practice and restrictions on behavior. A code of ethics sets up principles, and a code of conduct outlines behavior.

## Individual or Organizational?

Within government organizations, individuals are expected to do things right, and this focuses very much on process, and this underpins accountability. Codes of conduct shape these, but often individuals are not aware of these yet still perform with integrity. Accountability is enhanced when there is a culture of ethical leadership and integrity, a notion of "tone at the top."

When there is tone at the top, there is good guidance for individuals, as well as responsive management with a legitimate framework of control. The guidance includes the formal codes referred to as well as adequate training for staff and socialization into the operating ethos of the organization. Management policies and practices are clear and transparent and are in coordination by a special body or an existing central management agency such as a Civil Service Commission. Conditions for staff are negotiated and transparent and reasonably uniform or at least comparable. All of this takes place where the rule of law is well grounded and fully operational. There are laws within a legal framework enabling independent investigation and prosecution, and there are effective accountability and control mechanisms and penalties.

This shapes the accountability structure of individuals and is essentially a set of internal mechanisms. Organizational accountability has a focus on external scrutiny and more formal mechanisms. The lack of accountability sits alongside corruption. As Robert Klitgaard (1988, p. 75) points out, where there is monopoly and discretion but no accountability, a situation of corruption exists. To deal with this, most countries have established anti-corruption agencies (ACAs), and while they vary enormously in their powers and orientations, they essentially aim at increasing transparency and accountability. By limiting corruption, they enhance accountability. Sometimes they play their role after a corrupt event has been perpetrated, though often they have a preventive and educational role.

These external enhancers of accountability cover not only corruption but deal with waste, fraud, and abuse of office – the epitome of the lack of accountability. A full list of anti-corruption agencies and their legislation can be found on the TRACK website of the United Nations Office of Drugs and Crime http://www.track.unodc.org/Pages/home.aspx. The characteristics of success of an ACA are that the agency has a clear charter, independent from government, and a strategy of prevention, education, and sanction. Often there are; extensive coercive powers that might include the right to recommend criminal charges or even the right of arrest and detention. There should also be secure funding even in the face of major cutbacks in public expenditure. ACAs also need personnel of the highest moral caliber, public support of sufficient strength for them to go about their business with legitimacy, and overall political support which espouses accountability and the control of corruption.

In most countries there will be a range of additional accountability enhancements such as an audit office; an Ombudsman; a government accountability office; legislative committees, both of a standing nature and ad hoc committees; an inspector general that might be agency specific; and ultimately the press which will certainly call wrongdoers to account (if it is a free press) and myriad public interest groups that often are insightful and tenacious.

## Compliance or Values Based?

There is a long-standing debate on whether or in what contexts organizations can enhance integrity and accountability by pursuing a compliance-based approach or a values-based approach (Maesschalck 2004).

Indeed, evidence suggests that a narrow focus on compliance measures without regular and serious attention to ethics awareness, training, and leadership poses its own types of risk in developed, relatively corruption-free countries, such as Australia, New Zealand, the UK, or the Netherlands. Rules are not enough in rich countries as people who are loose with their organizational behavior will find ways to circumvent them. The story may be different in poorer and more corrupt countries, where a firm and enforceable set of rules is a fundamental starting point.

It is possible, in richer countries, to blend a compliance regime with a values regime. Legal, hard controls in the spirit of the compliance approach can certainly boost accountability, which may then blend with a values-based approach that works on doing the right thing and is backed by training, awareness, and ethical

leadership. The end point is to ensure that integrity and accountability are ingrained, as "regular" professional responsibility.

Too much compliance leads to over-accountability, and this can create operational gridlock, paralyze government, and make ordinary activities almost dysfunctional. This has been documented by Anechiarico and Jacobs (1996) in their study of the New York Police Department.

The research evidence is that accountability is more than compliance. Values shape the way civil servants approach accountability. Irrespective of legal requirements, a recent study found the operation of accountability is dependent on an individual's values (Kluvers and Tippett 2010, p. 51). This study found that values will either enhance or diminish accountability. Personal values of openness, cooperation, and service will enhance the relationship, while values of personal gain, emphasis on individual ambition, and manipulation of information will impede the relationship.

## Conclusion

Accountability is in play when an operator, either a body or an individual, performs tasks or functions which are subject to the oversight of others. Accountability involves elements of transparency, as well as answerability and enforcement. The tools and processes of accountability might be horizontal or vertical. Horizontally, public institutions can check other public institutions and ensure that a system of checks and balances prevents abuses of power and ensures accountability. Vertically, people in hierarchies enforce standards of those who are above or below, such as people in different levels of a bureaucracy or citizens (through voting or media) who can call to account standards of office holders. All of this operates within a framework where ethical processes are highlighted and should be the default but can be enforced by compliance mechanisms. Public policy is hard at the best of times, but when accountability is not present or treated as if it is not central to governance, then our public policy processes will be bankrupt.

## Introduction

The concept of accountability has a normative assumption and dependence, which makes it less analytical and more evaluative (Bovens 2007). It comprises a kind of social relationship between an actor and a forum, whereby the actor has an obligation to explain and justify his conduct to the forum. In this sense, accountability involves a cycle, which goes through the process of accountability, justification, and judgment of the actor in the forum, in which this evaluation process takes into account the value added by public

agents to the policies and actions of governments and public agencies.

Conceptually, accountability is the duty of public agents to be accountable to their principals, who, in a democratic regime, are citizens. In a democracy, accountability is an institutional mechanism by which citizens must influence and control their elected representatives, nonelected officials, and other power holders (Olsen 2017).

The governance debate views accountability as one of the fundamental principles for government and public administration structures to strengthen the publicity of their actions to citizens. The analysis of accountability can take place at the principle level, according to norms and values that organize the public sector. Or it may occur at the institutional level, according to the analysis of organizations, rules, and structures of agent behavior.

From the institutional perspective on accountability, it is fundamental to analyze the organizations, rules, and effects of their performance in government. In the case of accountability, there is usually not just one organization responsible for the performance of control and promotion of institutional learning. There is usually a set of organizations that implement checks and balances mechanisms and mutually control public organizations. In this way, it is necessary to think not only of a theoretical conception and principle of accountability but also of a conception that gives account of a complex set of organizations that are structured in the form of systems.

Accountability systems comprise this set of organizations that promote political and institutional control actions in accordance with checks and balances mechanisms and governance structures that promote public integrity.

## Framework

The premise of the concept of accountability is that governments must be accountable to citizenship (Filgueiras 2016). The accountability systems is conceived as the set of agents responsible for monitoring and controlling bureaucratic organizations, achieving compliance, and implementing principal preferences. Within democratic political regimes, the agents are organizations that exercise control, delegated by principals which are citizenship and constituted powers. Conceptually, an issue is central to the discussion of accountability: the exercise of agency power based on democratic norms and values that ensure the legitimacy and publicity of action. Thus, within democracies, accountability institutions are shaped for the exercise of control and vigilance in order to ensure the legitimacy of the actions of governments and bureaucracies.

The theoretical challenge of this principal-agent approach in the study of accountability processes is the causal understanding and attribution of responsibility, the punishment of unauthorized agent behavior, and the reward for compliance in order to promote a learning process with the successes and failures and the improvement of the political order and the institutions of the public administration (Olsen 2017).

The problem with this perspective is that there is a presumption that the organizations responsible for control know the preferences of principals and act strictly on the attributes of delegation. Agents act on behalf of and are responsible for a principal. Agents and principals make decisions that affect each other and are often associated with noncooperative games. Agents have better knowledge and strategic information and are opportunistic and unreliable. Principals, on the other hand, define the success criteria and establish the control incentives to achieve the desired behavior of the agents. The main problem is to have agents acting in the strict delegation process, following the preferences of the principals.

Since the control function is an essential governance function in the policy cycle, its agency depends on the delegation that authorizes it to control the other bureaucratic agents of the state. Delegation allows policymakers to make better policies, benefiting from the division of labor and specialization (Lupia 2001). Delegation can be beneficial to governors, but it can also cause problems, since agents receiving the delegation may act against the interests of their principal. The strategy adopted by politicians, in this case, is to abdicate the delegation, rendering it ineffective. The agency's expertise and capacity is

crucial for delegation to occur because it reduces the information costs and presents measurable results (McCubbins et al. 1987).

The problem with the principal-agent theory is that it supposes an endogenous process of delegation, often-disregarding political contexts and exogenous processes. Empirical studies show that principals and agents do not always fulfill their institutional roles (Schillemans and Busuioc 2015). The analysis of accountability institutions must therefore be conceived in the political trajectory of its institutional building, so it is necessary to observe the behavior of the various bureaucratic agents responsible for accountability processes. Thus, the analysis should be circumscribed in this process of development of accountability institutions in the context of demands for accountability and their impacts on the democratic political order (Olsen 2017).

Accountability, therefore, involves a complex trajectory of institutional development associated with political processes of delegation. Accountability institutions carry out organizational control activities associated with a political perspective of legitimacy building. These institutions have the mission of establishing institutional control and learning that strengthen governance in the public sector.

## Accountability Institutions in Brazil

The return of polyarchy conditions promoted a process of political openness, essential to the construction of democracy. Moreover, along with the return of elections, an incremental development process of state institutions, including accountability institutions, began. In Brazil, gradual conditions were established for the consolidation of the democratic regime, especially regarding the conditions of governability (Limongi 2006). Political competition, presence of opposition and clearer institutional rules promoted the development of accountability institutions, motivated by the fight against corruption and the expansion of checks and balances mechanisms (Melo et al. 2009).

The institutions of the accountability system must be autonomous and recognized by their operators as public authority for the supervision, control, correction, and punishment of illegal acts, in order to preserve the public interest. In this way, the system of accountability institutions implies a complex network, in which institutional competences are specific, but the actions of each institution depend on a process of sequencing and institutional cooperation with other institutions (Mainwaring 2003). In the case of Brazil, the extension of this network of institutions is quite broad, from the three republican powers to the media. Nevertheless, the core of this network is composed of four institutions: the Federal Audit Office, the Public Prosecutor's Office, the Federal Police, and the Federal Comptroller's Office. These organizations are responsible for supervising, controlling, correcting, and judicially prosecuting actions against public managers and politicians in cases of corruption, illegitimate acts, misuse or misconduct of the public interest (Aranha 2017).

The Federal Audit Office is an advisory body of the National Congress and was founded in 1891. The Federal Audit Office, as established by the Federal Constitution of 1988, exercises the external control of the public administration, through inspection actions and inform the National Congress of the correct exercise of the powers delegated to public agents. As time passed by, the Federal Audit Office has left its strictly legalistic competencies to assume performance auditing and public management control competencies (Speck 2000). This implied a critical turning point for the institution, because it meant, in addition to the expansion of its functions, the change of practices rooted in its administration. Another critical situation that represented a strong change for the Federal Audit Court was the Fiscal Responsibility Act, through which management and audit practices were added and regulated, requiring the institution to modernize its practices and invest in technology (Loureiro et al. 2009).

In the case of the Public Prosecutor Office, the establishment of its powers by the 1988 Constitution was also critical. The Federal Constitution established its functional and administrative autonomy, making it immune to political interests

and more empowered to act on the public scene. As for functional autonomy, it is the Public Prosecutor's Office's competence to exercise a judicial function in the State, and it is its responsibility to defend public and diffuse interests. Also, it has to defend the democratic regime, as well as public and social patrimony. The Public Prosecutor Office has the jurisdictional function of the State, which includes government supervision, control, and punishment of management irregularities. Their competencies are broader. The Public Prosecutor's Office is also in charge of accountability, for its typical powers include supervising and promoting legal proceedings against public managers and elected politicians. This resulted in institutional incrementalism marked by changes in practices, legislation, and competencies. However, the institutional incrementalism of the Public Prosecutor's Office was added by strong political voluntarism of its members, whose socialization occurs by defending the social interest of an apathetic society against a corrupt state (Arantes 2011a).

The same happens with the Federal Police, whose function of judicial police of the Union include being responsible for criminal investigation into offenses against public and social order, into detriment of goods, services, and interests of the Union or its municipal entities and public companies, as well as other infractions with interstate or international repercussion and that require uniform repression. The Federal Police was created in 1944, at the end of the Brazil's "Estado Novo," as Federal Department of Public Security, but its functions were circumscribed to the Federal District. In 1945, it gained national assignments. Only after the Constitution of 1988 were its powers established as judicial police of the Union, being recognized as permanent body with organizational structure. The permanent character of the Federal Police means that, despite being subordinated to the Executive Branch, the Federal Police cannot be dissolved by the government. The Federal Police's organizational structure implies that there must be rules for career promotion, police hierarchical definition, transparent rules for ascension, and organizational competence driven subdivisions. Accordingly, the staff of the Federal Police was expanded over time, as their budget grew. This is explained by the fact that the socialization of agents and delegates of the Federal Police has a strong component of reinforcing a repressive action against organized crime and corruption, associated with a strengthening of democracy (Arantes 2011b).

Finally, the creation of the Federal Comptroller's Office in 2003 underlies a process of long incrementalism in the internal audit and control of the Brazilian public administration. Prior to the creation of the Federal Comptroller's Office, the internal control system was decentralized to the various organs of public administration and coordinated by the Secretariat of Federal Audit Control, linked to the Ministry of Finance (Olivieri 2010). The Law 10,683/2003 established the Federal Comptroller's Office, which assumed and centralized all internal control activities of the Federal Government, as well as initiatives to prevent and combat corruption with functional autonomy. Prior to the creation of the Federal Comptroller's Office, the internal control of the Executive Branch was carried out by public administration bodies, in a decentralized and uncoordinated manner, and was not very effective when it came to auditing and auditing, as well as evaluating management practices. The Federal Comptroller's Office represented an important innovation process in Brazil, not only for centralizing the internal control activity and institutionalizing its practice within the public administration but also for disseminating management practices and transparency. The Brazilian Federal Comptroller's Office represents a process of functional conversion dictated by critical junctures of corruption scandals during the transition process from the Fernando Henrique Cardoso's Government to Lula's Government (Filgueiras 2018). Thus, the creation of the Federal Comptroller's Office was meant to institutionalize control practice, as established by the Constitution of 1988, with incremental gain of institutional changes in the accountability system. The institutionalization of internal control has allowed public administration to have a greater capacity for control and public policies monitoring, advancing the process of accountability.

## Strenghtening Governance in Brazil

The development of accountability institutions in Brazil implied a deep strengthening of governance processes. First, on the side of public integrity, the performance of accountability institutions has promoted the confrontation of corruption, penalizing politicians, bureaucrats, and businessmen involved in public scandals. Second, the strengthening of accountability institutions in Brazil has provided institutional learning, improving the conditions of organizations and the development of public service capacities.

The gains from the development of accountability institutions are also criticized. There are challenges regarding the unintended effects of accountability institutions, especially with respect to the red tape and paralysis effects of public sector bureaucracy.

In the dynamics of Brazilian democracy, accountability institutions have played a central role. Be it in the sense of exercising control of power, or in the sense of strengthening governance mechanisms, strengthening transparency, integrity, and promoting the quality of management.

# Accountability, Politics, and Power

Yousueng Han and Mehmet Akif Demircioglu
School of Public and Environmental Affairs, Indiana University, Bloomington, IN, USA

## Synonyms

Accountability: responsibility, liability, answerability; Politics: government, public affairs, power struggle; Power: ability, control, authority

## Definition

Accountability: Implicit or explicit expectation that one may be called on to justify one's beliefs and actions to others, and the extent to which a personâ€™s behaviors are observed and evaluated by others, with important rewards and punishments contingent upon those evaluations.

Politics: The activities associated with the governance of a country or other area, especially the debate or conflict among individuals or parties having or hoping to achieve power; activities within an organization that are aimed at improving someone's status or position

Power: The ability to do something or act in a particular way; the capacity or ability to direct or influence the behavior of others or the course of events

## Introduction

This paper explains the relationships among the concepts of accountability, politics, and power. More specifically, this paper will conceptualize and define accountability, frame accountability in terms of typologies, discuss the relationship between accountability and politics, and provide insights into the relationships among accountability, politics, and power. First, this paper provides major definition of accountability by discipline and explain well-known accountability frameworks. There are many definitions of accountability. However, it is important to discuss the topic based on the selected major definitions by area to induce coherent interpretation of accountability, politics, and power. Additionally, providing multiple definitions of accountability reduces uncertainties about the implications of accountability.

Second, this paper will discuss how, although at first glance these terms may seem unrelated to each other, these terms are in fact closely related to and affect each other. Changing accountability or accountability mechanisms involves politics and changing the distribution of power. Similarly, changing power relationships in organizations or societies involves changing the accountability of actors. All these processes involve politics. For instance, democratic accountability refers to a distribution of power among society, politicians, and stakeholders, while bureaucratic accountability refers to the accumulation of power within a bureaucracy. In order to shift structures of accountability, actors (primarily politicians) use politics or political behavior to convince other groups to make changes in power structures.

## What Is Accountability?

### Conceptualizing and Defining Accountability

Accountability can be defined differently based on social, cultural, or institutional conditions (Dubnick and George Frederickson 2011). Definitions of accountability can be understood according to some standards such as whether it focuses on individual or organizational level and whether it concerns public domain or not.

First of all, accountability can be defined with focusing on individual level. Individual level of analysis has been firstly offered by social psychology area. Lerner and Tetlock (1999) defined the individual accountability as "implicit or explicit expectation that one may be called on to justify one's beliefs, feelings, and actions to others" (255). According to the definition, an evaluation need not occur by the existence of evaluation system, but the possibility for an evaluation to occur must be present. Therefore, this approach to define the individual accountability reflects the psychological state on how individuals understand accountability requirements and environment in the macro–micro accountability framework rather. Based on extensive review on psychological research, Lerner and Tetlock (1999) confirmed that the simplest dimension of the individual accountability include empirically distinguishable four sub-manipulations (255): (a) mere presence of another (participants expect that another will observe their performance), (b) identifiability (participants expect that what they say or do in a study will be linked to them personally), (c) evaluation (participants expect that their performance will be assessed by another according to some normative ground rules and with some implied consequences), and

(d) reason-giving (participants expect that they must give reasons for what they say or do). This accountability definition focusing on individual level in social relationship has been widely accepted to organizational behavior and human resource management area. For example, Ferris et al. (1995) defined the accountability as "the extent to which a person's behaviors are observed and evaluated by others, with important rewards and punishments contingent upon those evaluations" (187). In fact, the definition was one of the first that addressed accountability in the organizational context.

Second, for understanding accountability phenomenon in "public" domain, several public administration scholars have tried to define and frame the "public" accountability concept. For example, public accountability could involve "the means by which public agencies and their workers manage the diverse expectations generated within and outside the organization" (Romzek and Dubnick 1987, p. 228). The public agencies should establish various accountability instruments to respond to expectations from legal entities, citizen, top executives, or organizational members. Therefore, diverse formal instruments to make public agencies accountable, for example, performance measurement or performance-informed budgeting system, could be understood as one of the diverse accountabilities (e.g., Moynihan and Ingraham 2003; Gilmour and Lewis 2006b; Yang 2011). To give shape to the meaning of the public accountability, the multi-dimensional components of the accountability have been disclosed. Koppell (2005) argued that the public accountability conceptually consisted of five dimensions (p. 96): "transparency (revelation of information), liability (consequences for performance), responsibility (conformity of rule), responsiveness (fulfillment of expectation), and controllability (controlled as principal desires)." This conceptualization emphasized that the dimensions of transparency and liability are foundation building up other three dimensions.

On the other hand, accountability has been used interchangeably with other similar concepts although holding different conceptual implications. For example, responsibility is most closely related to accountability, so that the two terms have been used often jointly and/or interchangeably in practice and research. But, conceptually, responsibility is clearly distinct from accountability (Schlenker et al. 1994), and scholars generally have recognized that they are separate constructs. Schlenker et al. (1994) disclosed empirically that responsibility is a component or factor within a broader concept of accountability. Responsibility connotes personal causal influence on an event or an internal sense of duty, but it does not subsume the existence of audience to observe individual that is crucial factor of accountability concept. Additionally, the responsibility concept does not cover evaluation expectation. Responsibility is an internal path while the felt accountability is the external, social, and public process foreseeability (Cummings and Anton 1990). The responsibility is "a necessary component of the process of holding individuals accountable for their conduct" (Schlenker et al. 1994, p. 634). Whether individual is responsible to only self or becomes accountable to salient external audience is a separate issue, so that the two concepts result in different employee outcomes. On the one hand, answerability, fidelity, amenability, obedience, and obligation, each also has been frequently used interchangeably with accountability. However, each is linked to different forms of account-giving mechanisms (Dubnick 2002).

### Framing Accountability in Typologies and Power Relationship

Public accountability literature reveals that many efforts exist to frame the dynamic and complicated phenomena of public accountability. The typology of public accountability has been developed from as few as two types (e.g., horizontal and vertical accountability) to as many as 12 types (Lindberg 2013). Overall, accountability has been normatively recognized as a good thing because it was assumed to bring meaningful positive qualities such as legitimacy to organizations (Dubnick and Frederickson 2009). Dubnick and Frederickson (2009) have classified accountability as three general types – input, process, and outcome – and as six particular types – control, integrity, ethical behavior, legitimacy,

performance, and justice. For example, accountability solutions for performance and performance measurement are assumed to improve performance. Likewise, accountability in organizations can be expected to increase ethical behavior, organizational justice, and the legitimacy of organizations and individuals.

In this regard, the term "power" comes to play an important role and becomes an interesting phenomenon within accountability typologies and dimensions. However, despite promising research integrating accountability and power, scholars have not made efforts to analyze these topics together. Power refers to the ability, capability, or influence to accomplish an action or change the behavior of others. Based on Dubnick and Frederickson (2009)'s typology, accountability can increase the legitimacy of public organizations and public managers. When a public organization becomes more legitimate in the eyes of stakeholders and has a higher performance, organizational leaders will have more power compared with managers in organizations that perform poorly or lack organizational justice and ethical behavior.

Behn (2001) sorted accountability into four types – accountability for power, performance, justice, and finance. These four types of accountability can increase trust, democratic behavior, collective responsibility, and the effectiveness of management. The accountability of power can reduce the abuse of power by government employees, which is crucial for democratic societies. Behn (2001) states, "Why do we worry about accountability in government? Because we fear that public officials – elected officials, appointed executives, or civil servants – will abuse power. And many public officials do have a lot of power. They award contracts worth millions or billions of dollars to some but not to others. They decide to grant benefits to some and not others. They decide to prosecute some and not others. They decide to convict some and not the others. . .Thus, as citizens, we seek to constrain the behavior of public officials, to limit their discretion, to prevent them from abusing their power" (Behn 2001, p. 9). Behn (2001) also suggests, "When we are worried about the abuse of power (for either finances or fairness), we do need individual accountability. After all, it is the individual person – the human agent – not the collective organization, that abuses power" (Behn 2001, p. 67). According to Behn, power is a crucial dimension of accountability. Thus, studies of accountability should include discussions of power, as both concepts affect one another and different accountability mechanisms may establish different power structures.

One seminal article by Romzek and Dubnick (1987) has been widely used as a foundation to frame and understand the complex nature of public accountability (Table 1). They divided accountability into four types – political, bureaucratic, legal, and professional – by the standards of control source and control degree.

Table 1 has several different implications. First, bureaucratic accountability concerns managing expectations from those at the top of bureaucratic hierarchy and the expectations occurring between superiors and subordinates in the bureaucracy. Higher-level bureaucrats will impose sanctions on public employees if they violate a rule, so the source of agency control is bureaucratic. This implies that bureaucracy is a powerful source of accountability compared to legal, professional, and political sources. Second, legal accountability is used as a mechanism to manage expectations from outside parties such as Congress or courts in the position to impose and oversee laws, policy mandates, and contractual obligations, namely; the expectation is characterized as formal and horizontal. Thus, the legal source has more power than other sources in terms of accountability systems. Third, professional accountability requires managing expectations of professionalism as public organizations rely on skilled and expert employees. Such officials

**Accountability, Politics, and Power, Table 1** Types of accountability systems

| | | Source of agency control | |
|---|---|---|---|
| | | Internal | External |
| **Degree of control over agency actions** | High | *1. Bureaucratic* | *2. Legal* |
| | Low | *3. Professional* | *4. Political* |

Source: Romzek and Dubnick (1987)

request that managers trust them to do the best job possible and are held accountable for the job done by being rewarded or sanctioned. The control is placed in the hands of the relevant public employees. Outside professional associations may indirectly influence the mechanism, but the nature of the control is inside the organization. As a result, professional control mechanisms have more power compared to other sources. Fourth, political accountability includes managing the expectations of elected officials, interest groups, and/or the general public. It concerns being responsive to or satisfying their demands/needs, so politicians have more power compared to other sources in this type of accountability system.

Lindberg (2013) divided accountability into 12 types using the standards of control source, control strength, and control direction. Table 2 shows these types (see the article for detailed explanation). Each accountability type indicates different power mechanisms. For instance, a business type of accountability occurs when the source of control is internal, strength of control is high, and the nature of relationship is upward-vertical. In this accountability type, the business has more power to control than other sources such as Client–Patron and Patron–Client. A political type of accountability characterizes the downward, external, and low strength of control, while the legal type of accountability occurs in with horizontal, external, and high strength of control.

Accountability can be divided into types according to whether it reflects formal or informal mechanisms. Formal aspects of accountability concern laws, performance measures, reporting relationships, stipulated rewards, or contractual terms, while informal aspects of accountability focus on informal norms such as verbal agreements, shared culture, trust of a leader, etc. (Klingner et al. 2002; Romzek et al. 2014). The attitudes of individuals can be influenced by the attitudes of, behaviors of, and communications with others. Individuals adhere to the unspoken rules of conduct in an organization as well as the formal rules. If they defect on verbal agreements or fail to adhere to informal norms including trust, they can be punished informally. This mechanism results in behavior accountable to such informal expectations, leading to performance. For framing other specific contexts of accountability, other scholars have used the concept of social accountability (e.g., Brinkerhoff and Wetterberg 2015), referring to citizen empowerment to make public officials accountable or the concept of voluntary accountability (e.g., Karsten 2015), i.e., that people will willingly submit themselves to scrutiny even when it is not required. In this regard, these statements are consistent with Behn's (2001) claims that "we do need individual accountability" and that social and voluntary accountability systems are very helpful for reducing the excessive power of individuals.

## Accountability as a Process

Accountability has also been understood as an evolving process consisting of three steps: information provision, discussion, and consequence between accountability actors and accountability forums (e.g., Day and Klein 1987, p. 5; Mulgan 2003, p. 9). These stages are interconnected, and any one stage cannot be disregarded in understanding accountability. For example, the reporting requirement of Congress is one accountability tool affecting agency performance. However, Congress should assess the performance information provided from the executive branch, and Congress can impose sanctions on agencies based on the evaluation results.

**Accountability, Politics, and Power, Table 2** Types of accountability

| | | Vertical | | |
|---|---|---|---|---|
| Source of control | Strength of control | Upward | Downward | Horizontal |
| Internal | High<br>Low | *Business*<br>*Client–Patron* | *Bureaucratic*<br>*Patron–Client* | *Audit*<br>*Peer Professional* |
| External | High<br>Low | *Representative*<br>*Societal* | *Fiscal*<br>*Political* | *Legal*<br>*Reputational* |

Note: Source Lindberg (2013)

Generally, the process is sequential, so that after an accountability actor provides performance information for the forum and the information is evaluated and discussed, the forum assigns rewards or sanctions. However, the process need not necessarily be sequential, and steps can be omitted. However, it is desirable to consider all three steps of the accountability process rather than focusing specifically on one or two stages in order to better capture the dynamic nature of accountability phenomena. For example, looking at the accountability system of information requirements on agency performance, we have to be able to examine how intensively Congress evaluates the information submitted from agencies and how intensively Congress imposes sanctions as a result of bad performance. Brandsma and Schillemans (2013) applied a model of the accountability process consisting of three components – "information provision," "discussion," and "consequence" – to measure the accountability deficits of the European Union (EU) comitology. They concluded that the system worked generally well in terms of the three processes.

Behn (2001)'s classification of accountability – accountability for power, performance, justice, and finance – focuses on both the process and the outcome. Traditional public administration overemphasizes accountability procedures involving finances and justices. However, the importance of accountability as a process has diminished with the New Public Management (NPM) movement. Behn (2001) has criticized NPM's premise. According to Behn, accountability as a process is always important, and public organizations should not overlook this concept. Meanwhile, politicians or bureaucrats dealing with accountability as a process can increase their power. For instance, Pfeffer (1992) states that formal authority, controlling resources (e.g., budgets and finance), and information access (e.g., performance information) create power. Elected and appointed officials who can control these processes by holding formal authority, controlling resources, and accessing information potentially have more power than other employees. This may cause a potential abuse of power on the part of bureaucrats and politicians, so they need to be careful about exercising power. They also need to be accountable to stakeholders. For instance, employees have to be treated fairly, and organizational justice should be at the top of a public organization's agenda. Additionally, organizational processes (e.g., budgeting and hiring employees) need to be transparent.

## Accountability and Politics: Political Accountability

Finally, political accountability is an interesting concept in which politics and accountability overlap. This section discusses how accountability is manifested in political situations within various contexts. Political accountability is central to the democratic control imposed on public administration systems (cell 4 at Table 1). Public administrators are representatives of the general public, elected officials, agency heads, agency clients, interest groups, and future generations. Democratic representatives work with public funds, including taxes, and are accountable to be responsive in their policy programs and to the demands of their constituents, such as clients and the general public. If the government is held accountable to the citizens paying taxes to the government in a democratic society, then the government will be able to receive positive support from the citizens. However, a public bureaucracy can be controlled by interest groups and subcommittees of Congress rather than by the general public.

The government requires performance reporting from nonelected delegated agencies, such as the US central bank. Congress can control the executive branch by legislating political appointments to some positions. For example, Gilmour and Lewis (2006a) found that federal programs administered by senior executives performed better than those administered by political appointees requiring Senate confirmation. The political appointees influenced the performance, and the programs run by political appointees received lower performance grades. This implies that allowing less political intervention and granting more authority to agencies are

required to improve organizational performance. Furlong (1998) disclosed that Congress and the President's control were more influential on bureaucratic policy making than the media or the courts, while Golden (1998) found that competing interest groups were more influential on the rule-making process of unelected branches of government. Wood and Waterman (1991) found that political appointee system symbolizing shared power by the president and congress among various political control instruments are most influential to bureaucratic outputs. Namely, the studies reflect how the executive branch was responsive to bureaucratic control to ensure democratic accountability.

Despite diverse political efforts to control bureaucracy, there are obstacles that can curb the impact of political control. According to the argument of West (2005 and 2006), because of organizational complexity such as horizontal coordination and vertical coordination, the presidential control of the executive branch can decrease. Because of the moral hazard problem that bureaucrats (agents) can work by using information asymmetry against the intentions of the elected officials (principals), the impact of political control on the bureaucracy can be alleviated. For example, the Office of Management and Budget (OPM) established by the president in order to promote executive leadership was politicized for someone else's interest rather than for the president.

Thus, political accountability has different interpretations. On the one hand, the power given to elected officials is consistent with democratic theories simply because since politicians are elected, citizens are the main principles. On the other hand, the power given to politicians can cause too much politicization and less effective management. Giving power to bureaucrats may increase the efficiency and effectiveness of management because they are the experts at the job. However, giving too much power to bureaucrats may create a democratic problem because bureaucrats may not listen to elected officials. Pfeffer states, "problems of performance and effectiveness are problems of power and politics – power imbalances, powerlessness, and the inability of some groups to get their ideas or suggestions taken seriously" (Pfeffer 1992, p. 334). A good balance is needed in which effective powers are allocated each actor so that the system continues to be democratic without politicization or undermining management. In other words, power should include both representativeness and effectiveness. Public organizations need to be particularly careful about exercising power, particularly when it comes to political power.

## Conclusion

This paper has provided information about accountability, politics, and power. Accountability has been defined and types of accountabilities are explained. There are a variety of accountability actors involved in the accountability relationships in a public organization. Accountability relationships can be horizontal or vertical and strong or less strong. Public accountability is a complex and dynamic phenomenon, as it can be understood as adding diverse concepts to the term "accountability" – for example, public, democratic, political, social, voluntary, informal, professional, self, organizational, fairness, process, finance, and so on. Terms such as answerability, responsiveness, transparency, responsibility, controllability, liability, or integrity have been also used to describe accountability. This chapter particularly aims to find connections and interactions among these concepts. Because accountability and politics involve many actors, influence, and dependent relationships, the issue of power becomes inevitable and needs to be explored. Depending on the type of accountability or political structure, power structures and power usage may be different: "Power is used more frequently under conditions of moderate interdependence. With little or no interdependence, there is little or no need to develop power or exercise influence. By the same token, when interdependence is great, people have incentives to work together, forge common goals, and coordinate their activities. If they ignore these incentives, then their organization or group is likely to fail" (Pfeffer 1992, p. 38).

# Accountability: Breaches and Trust

Faith Butta and Joanne G. Carman
University of North Carolina at Charlotte, Charlotte, NC, USA

## Synonyms

Answerability; Board governance; Duty; Ethical obligation; Ethics; Fraud; Liability; Misconduct; Responsibility

## Definition

Accountability: The obligation to act responsibly and with transparency
Breach of trust: A violation of accepted duties, by action or inaction, both intentionally or inadvertently

## Introduction

Nonprofit organizations are accountable to multiple and frequently competing stakeholders – both in theory and in practice. In the general sense, accountability is being responsible, transparent, and responding to stakeholders, which may be challenging for nonprofits who must answer to numerous stakeholders including funders, program participants, employees, and taxpayers. Realistically, this means that acting in a responsible manner in the eyes of one stakeholder may be, or appear to be, in conflict with acting responsibly to another stakeholder. Regardless, nonprofit organizations should strive to both act responsibly and with transparency. What happens if they fall short in one or both areas? The failure to ensure accountability is a breach of trust. In reality, breaches of trust are not usually a single one-time event that either happen or not; they often occur over a range of time, including multiple events. The number and instances of irresponsibility can vary because it is not a black and white issue; there are many shades of gray. This is because there is not a preset guideline as to what is or is not acceptable in all and every case. There are some rules and regulations in place set by the regulatory agencies, state laws, boards of directors, and funder stipulations, but even these cannot be concretely applied in every situation. Exactly what level of responsibility and how much transparency do nonprofit organizations need to demonstrate in order to be considered acting accountable? Since there is no predetermined answer, it can often be difficult for nonprofits to balance the demands of accountability in order to ensure trust while working to fulfill the organization's mission.

## Nonprofit Accountability

Nonprofit organizations play a variety of roles in today's society. They are religious organizations, foundations, social advocacy groups, and public charities which provide services that government and the private sector may not provide. Although the nonprofit sector is its own individual sector, nonprofit organizations are accountable to numerous stakeholders – both within and outside of the organization. For example, nonprofits are accountable to its employees, its clients, to funders, to local and national governments, and to the community it serves (Brody 2002). Each of these groups may have a specific vision in mind for how the nonprofit organization should operate and focus its limited resources. These visions may overlap, or they may compete with one another. This makes the idea of being accountable complicated. If taken too narrowly, the nonprofit organization will be unable to address stakeholder's concerns. If taken too broadly, the nonprofit organization may never accomplish anything.

## Breaches of Trust

According to some, trust is the most expensive commodity in the world, and so earning and maintaining trust is especially crucial for nonprofit organizations. The relationships that are created between nonprofit organizations with clients, stakeholders, and the public can take years to cultivate and only minutes to destroy. This is why it is necessary to carefully screen volunteers and employees, in addition to making sure the organization is adhering to laws, policies, and principles already in place. This section describes the range of breaches of trust that can occur.

Most individuals who volunteer or work for nonprofit organizations have good intentions. Nonprofit organizations, however, are just like other organizations in that they can be susceptible to fraud, abuse, and breaches of trust. In order to minimize the risk of fraud, abuse, and breaches of trust and ensure financial accountability, nonprofit organizations can employ a number of internal

controls and policies for financial and risk management (Kearns 2012). For example, it is important for nonprofit organizations to create budgets, business plans, and keep detailed and accurate financial records, which are reviewed regularly by the board, as well as outside financial experts and/or auditors. While administrative and fundraising expenditures are important and necessary, the majority of the expenditures, typically 65% or more, should be dedicated to fulfilling the mission of the organization.

Nonprofit organizations should also have formal policies relating to financial management, record keeping, expenses, reimbursements, purchasing, and travel, and there should be controls in place relating to financial transactions. Some examples of controls are a segregation of duties, requiring multiple signatures on checks, and approvals of expenditures (Zack 2003). Policies relating to conflicts of interest and whistleblower protection should be in place, along with internal controls relating to the hiring of employees and engaging with volunteers. Examples of these are criminal background checks, reference checks, verification of degrees, professional credentials or licenses, and drug testing. Like any other organization, nonprofit organizations need to be properly insured and understand the risks associated with the varied nature of the work that they do (McMillan 2006).

Even with policies and procedures in place, nonprofit organization are susceptible to fraud, abuse, or a breach of trust. Some infractions are seemingly minor. For example, an employee might use the organization's credit card for a personal purchase. A book keeper might misclassify expenditures to minimize the overhead ratio, or a grant-writer might overstate the organization's capabilities or accomplishments in order to look good to a funder. Yet, other infractions are more notable. A scan of the media's headlines of some of the more recent nonprofit scandals reveals some major infractions, including misuse of funds, misappropriation of funds, embezzlement, excessive executive compensation, luxury accommodation and travel expenditures, and illegal loans to board members or executives.

Although nonprofits may seem to exist in their own sector, organizations are not isolated from the other sectors. In fact, just the opposite is true. Because nonprofits are interdependent and collaborate with people and other institutions from all sectors, they are becoming more intertwined with other entities. This takes place at local, national, and international levels.

Globalization provides a platform to give and receive donations anywhere around the world, while at the same time makes it increasingly difficult for donors to "see" where their aid is going. Because of this, one area of nonprofit frauds that has gained more media attention over the past two decades is in disaster relief efforts. Even long-standing reputable organizations like the American Red Cross can find themselves in the midst of a scandal. Headlines like: "As Scandal Breaks, Red Cross Gives $2M Grant to Sandy Survivors" (Hasan 2014) and "How the Red Cross Raised Half a Billion Dollars for Haiti and Built Six Homes" plaster newsfeeds and timelines for weeks or months at a time (Elliot and Sullivan 2015). Instances like these can be the action of one person, or the orchestration of an entire organization. It can take years within the judicial system to sort through the allegations and determine if and when a fraud and/or misrepresentation occurred. Until that point is reached, it is those who have the most need for the disaster relief services who are most negatively affected.

Like many offenses, the penalties facing nonprofits caught in a scandal or fraud vary substantially – though any and all sanctions negatively impact organizations. Typically, the consequences are commensurate with the level of the infraction, ranging from taxes, fines, or damages being assessed to the perpetrator (perpetrators) to jail or prison sentences. Yet, the damage to the nonprofit organization can be cascading, ranging from a damaged reputation, losses of donations, funding, and volunteers, the revocation of tax exempt status, and shutting down the organization. The consequences of each incidence of fraud, abuse, or breach of trust also effects the nonprofit sector as whole, with donors being more reluctant to give to other nonprofit organizations and increased public scrutiny.

## Nonprofits and Trust

Nonprofit organizations are thought to be more trustworthy than private corporations because their goal is to fulfill their mission and not maximize profits. Consumers are assumed to be more inclined to trust a nonprofit organization over a for-profit organization in a variety of contexts, such as when they need information, are feeling vulnerable, need of assistance, or are facing a crisis. There is also a general sense that individuals who choose to work in the nonprofit sector are more trustworthy then those who work for government or the private sector (Young 1998). By choosing to work for a nonprofit organization, they have demonstrated that they are more interested in public service, and not as interested in making money or engaging in profit-seeking behavior. Moreover, these individuals are acting as stewards for the organization and its mission. In contrast to being self-serving and out for personal gain, they are viewed as being public serving and putting the interests of the organization and its mission first.

A closer look at how goods and services are actually delivered, however, reveals that it is more complicated than having three distinct public, private, and nonprofit sectors, providing three distinct types of goods and services. For example, medical care might be provided by a public organization, for example Veteran Affairs Medical Centers, a private, for-profit medical practice, for instance a group of medical doctors who form a Professional Limited Liability Corporation, or a nonprofit organization, like a community health clinic or nonprofit group health practice with 501(c)(3) charitable organization tax status. These different organizations, for the most part, will serve different groups of people. The public organization, in this case the Veterans Affairs Medical Center, only provides services to consumers who are eligible, specifically military personnel and veterans. Typically, the private, for-profit medical practice will only provide services to consumers who can afford to pay their fees, either directly or through insurance reimbursement payments. In contrast, the nonprofit community health clinic could, theoretically, serve everyone; consumers who can pay full price for services, as well as those who cannot because the nonprofit organization is able to take advantage of tax exemptions, tax deductible charitable contributions, and access foundation grants and/or government subsidies (Grønbjerg 1998). Moreover, the issue of trust also comes into play.

It is difficult to surmise exactly how much trust matters in nonprofit organizations, both within the organization itself, as well as among the relationships organizations have with the government, businesses, and other nonprofit organizations. Putting a dollar figure to the role of nonprofits sheds some light to this by illuminating how nonprofits function within a larger societal economy.

For example, while giving varies from country to country, according to Giving USA, in 2014, Americans including individuals, foundations, and businesses donated nearly $360 billion to charities which continues the trend of increasing donations for five consecutive years (Giving USA 2015). Also, over one-quarter of the adult population volunteer annually. These 8.7 billion hours is valued at over $179 billion. But nonprofit organizations as a sector are receiving and contributing more than strictly donations. There are roughly 1.4 million nonprofits registered with the Internal Revenue Service, employing millions respectively. Additionally, nonprofit organizations account for over 5.4% of annual gross domestic product, or roughly $906 billion to the economy in 2013 (McKeever 2015), providing a vast array of services to promote social welfare, working in areas such as education, health, youth, sports, and the environment, as well as with our most vulnerable populations. Nonprofit organizations are also the cornerstone for advocacy, social justice, and civic engagement efforts, and they are typically praised for being more innovative, flexible and efficient at providing services to those in need.

## Framing Accountability

Accountability can be thought of from several perspectives. For example, it can be outlined in

laws and regulation. Additionally, it can be brought through the lens of public responsibility and professional responsibility. Sometimes these frames overlap, as in the case of fiscal accountability. While financial accountability is important and necessary, there are other dimensions of accountability relating to compliance, transparency, and mission and performance. With respect to compliance, nonprofit organizations must be sure they are not only in compliance with the laws and regulations associated with the work that they do, but they are also complying with conditions of the transactional relationships they have with funders and donors. Compliance-related activities typically involve site visits, inspections, reporting, and audits by outside organizations. These may be mandated by the government or done voluntarily as part of the organization's internal policies and procedures. Nonprofit organizations are also subjected to many reporting rules, such as filing federal annual tax returns and making this information available to the public, reporting on unrelated business income, and filing annual reports to the state in which they are incorporated.

With respect to transparency, unlike private corporations, there is an expectation that information about the nonprofit organization including its mission, finances, activities, and all other facets of the organization be readily available to the public (Ebrahim and Weisband 2007). To that end, nonprofit organizations typically disclose information on their website and elsewhere about the mission of the organization, the names of the board members and staff, financial statements, and other information about the organization's activities.

With respect to the mission and performance, the mission statement should be a short description about the basic purpose of the nonprofit organization, the nature of their work, and the constituent group (or groups) that they intend to serve. From there, the mission should be translated into a set of strategies with concrete, reasonable goals that will be accomplished according to specific time periods.

Increasingly, however, foundations, government, other funders, and donors are paying closer attention to the framing of an organization's mission. It is no longer acceptable just to have a mission statement. There is now a greater emphasis on whether the theory of change behind the mission makes sense and whether the goals are actually achievable. There is also a greater interest and emphasis for nonprofit organizations to implement programs that have been shown to work also known as evidence-based practice. Growing resources like What Works Clearinghouse at the Department of Education and the Outcomes Indicators Project at the Urban Institute are being made available to nonprofit organizations to guide them (Fulbright-Anderson and Auspos 2006).

Program evaluation and other types of data collection efforts can then help nonprofit organizations systematically track and assess their performance. For example, performance measurement is one tool that nonprofits can use which involves tracking key pieces of information over time, such as: the number of people served, the number of meals provided, the number of job placements. This can be done internally, by program staff, generally requiring few additional resources. Benchmarking is also another tool, where nonprofit organizations compare their performance to that of similar organizations or leaders in their industry. Hiring an external evaluator to conduct an outcomes study is also another option, though this requires more resources.

Equally valuable to the undertaking of data collection and analyzation is how the information becomes available or is displayed. An evolving aspect of data visualization that nonprofits can capitalize on are dashboards. It is a continuously updated graphic representation of program services that nonprofits offer, and can also be used to track funding. Dashboards can be a chart, graph, or other illustration which display the progression of a measurement toward an established goal. For instance, one organization might use a dashboard to show the number of meals served today, since last week, and since last year. At the same time, they could show what percentage toward their goal they have already achieved and what is remaining. Taken together, these types of

performance and evaluation data can help nonprofit organizations to assess how well they are achieving the mission of the organization.

The extent to which nonprofit organizations engage in performance measurement and other types of evaluative activities varies widely in practice. Some organizations simply do not evaluate what they do or track their performance. Others focus just on compliance, or they gather performance data and conduct evaluation only in response to external requirements from funders.

## Improving Accountability

Growing concerns about nonprofit accountability and breaches of trust have given rise to a several developments within the nonprofit sector intended to improve accountability practice and minimize the opportunities for breaches of public trust. For example, there are now a variety of organizations that exist to assess nonprofit organizations in the United States. The Better Business Wise Giving Alliance, Charity Navigator, and Guidestar go so far as to give them a rating or a score for the performance. Additionally, some nonprofit organizations also seek out accreditation, which involves an external review by an independent organization to assess the quality of service delivery practices. In some service fields like health care, adoption, and substance abuse treatment, as well as in some states, accreditation is actually a requirement for nonprofit service delivery.

There is also a growing awareness that managing a nonprofit organization requires a specific set of knowledge, skills, and expertise. In response to the growing numbers of nonprofit organizations in need of professionalized management, universities and colleges are offering a range of educational opportunities for nonprofit managers and their staff, including undergraduate majors and minors in nonprofit management, graduate certificate programs in nonprofit management and administration, and master's degrees in public or business administration with concentrations in nonprofit management. Moreover, doctorate programs in nonprofit management and leadership and philanthropy are emerging as well. While these programs cover traditional management topics, such as human resources, budgeting, and strategic planning, they also cover a range of topics specific to the sector, including volunteer management, fundraising, program development, and program evaluation.

Training opportunities also exist in many different formats. Some are offered by national organizations like The Foundation Center, and Independent Sector. Others are offered by state associations like the Maryland Association of Nonprofits or local funding agencies like the United Way which provide books, toolkits, journals, and webinars about how to improve the effectiveness of nonprofit organizations. Moreover, credentialing is becoming more popular, with different certifications being offered by professional associations, such as the Certified Nonprofit Professional by the Nonprofit Leadership Alliance and the Certified Grant Writer by the American Grant Writers' Association.

## Conclusion

Nonprofit organizations function in what can be thought of as an "accountability environment." This environment consists of several facets including pressures that face the organization legally, politically, financially, and culturally. These pressures encourage people within nonprofits to act, or not act, in certain situations. These entities operate with the realization that they are responsible to multiple stakeholders at any given time. This is an understood aspect of a sector simultaneously responsible to government, private funders, program participants, and the community at large. Additionally, due to the nature of many organizational program services, nonprofits have earned the reputation of being trustworthy. As such, they are often under tighter scrutiny to demonstrate that public trust is indeed justifiable earned. This explains why breaches of trust are deemed especially appalling.

Because of this complexity, it is imperative that organizations place a meaningful emphasis on their accountability in order to create and promote a positive environment. A two-step approach of

prevention and detection can assist in preserving public trust. Financial accountability can largely be attained through stringent and transparent record keeping. While, performance-based accountability can be accomplished through program monitoring and evaluations. In general, responsibility can be demonstrated through ethics codes, as well as achieved through advanced professional degrees and certifications of employees. Both internal and external controls are essential in creating and maintaining accountability.

# Accounting for Employee Benefits

Yuri Biondi[1] and Marion Boisseau-Sierra[2]
[1]Cnrs – Labex ReFi (ESCP Europe), Paris, France
[2]Université Paris-Dauphine, PSL Research University, Paris, France

## Synonyms

Benefits in kind; Fringe benefits; Nonwage compensation; Perks; Perquisites

## Definition

From the employers' viewpoint, pension benefits are promises to and claims by employees based upon future inflows. To make employers accountable for fulfilling these obligations in due course, accounting for pension obligations must design representation and facilitate control through time

and circumstances, including through financial reporting and disclosure which aim to facilitate pension protection, that is, the assurance of continued provision of pension payments at their agreed levels under viable alternative modes of pension management.

## Introduction

Employee benefits cover various advantages granted to employees in addition to their salaries, especially pensions to be received after retirement. Historically, the pension was considered as a protection granted to the old or the sick. However, the recent reforms tend to blur the frontier between investment and pension, showing a radical transformation. Employee benefits concern both the private and the public sector. Accounting for them has been a critical matter throughout the international accounting convergence process for both private and public sector employers.

This encyclopedia entry analyzes international accounting standards on employee benefits for both the private (IAS 19) and the public sector (IPSAS 25). Both standards follow the recent trend toward understanding pension as deferred remuneration. Their actuarial basis of accounting further involves a representation in terms of individual saving account managed on behalf of their beneficiaries as a form of financial investment. In fact, this understanding neglects the diversity of existing pension schemes. Overcoming the classic opposition between defined benefit and defined contribution concerning pension systems, this entry outlines an accounting model for pension funds and flows over time, to better comprehend current variety of practices and provide a comprehensive basis of accounting representation.

The rest of this entry is organized as follows. The first section presents the international accounting convergence between private and public sectors developed by the IASB and then by the IPSASB. The second section asserts that this international accounting model does not take into account the existing variety of pension schemes, providing illustrative examples from the private and the public sectors. The third section develops further thoughts for a more comprehensive understanding of accounting for employee benefits.

## International Accounting Convergence Between the Private and the Public Sectors

Private sector standards under the IAS (section "Private Sector Accounting for Employee Benefits Under the IAS/IFRS)" and public sector standards under the IPSAS (section "Public Sector Accounting for Employee Benefits Under the IPSAS") are based upon a financialised model that is unveiled by our analysis (section "International Accounting Convergence Involves a Financialized Accounting Model"). This section will pay attention especially to accounting for defined benefit pension schemes as they are at issue throughout the recent reforms.

### Private Sector Accounting for Employee Benefits Under the IAS/IFRS

In the recent decades, political and financial economic strategies designed to develop active financial market places have led a growing number of accounting representations across jurisdictions to consider pension obligations as deferred remuneration, to be attached today to individual pay and expensed through actuarial measurement of future cash outflows. In particular, the IAS 19 – issued in 1998 – defines accounting for defined benefit plans as follows:

> The measurement of a net defined benefit liability or assets requires the application of an actuarial valuation method, the attribution of benefits to periods of service, and the use of actuarial assumptions. (IAS 19 2011, p. 66)

Pension accounting has caused controversies ever since standard setters started to regulate the recognition and valuation of pension-related liabilities, assets, and costs. In 1985, the US Financial Accounting Standards Board (FASB) prompted the adoption of a balance sheet accounting approach for pensions through the Financial Accounting Standards 87 (FAS 87) issued in

1985, followed by the International Accounting Standards Committee (IASC) which proposed a single actuarial method in its Exposure Draft (ED 54) published in 1996 (eventually adopted in 1998 as IAS 19). Both reforms were controversial and beyond what was common practice at those times, echoing the overall lack of consensus on the legal-economic nature of corporate pension obligations. This private sector trend influenced the public sector accounting standards first through national statistics and later through the governmental financial accounting channel. The question whether the standard IAS 19 should be applied to the public sector has firstly been discussed by students of national statistics and then by the International Public Sector Accounting Standards (IPSAS) Board.

### Public Sector Accounting for Employee Benefits Under the IPSAS

The IPSAS are developed by the IPSAS Board under the auspices of the International Federation of Accountants (IFAC). This privately run body has been transplanting the IFRS developed by the IASB into the public sector. To be sure, the IPSAS are not currently adopted by any major jurisdictions, although the IPSAS Board has been developing its standards as a professionally endorsed "best practice," which has been having a significant influence on the ongoing public sector accounting debate and regulation. Contrary to the IAS/IFRS (which have been substantially adopted by the European Union for consolidated statements of corporate groups listed in European regulated exchanges), the IPSAS do not have compulsory authority to rule accounting practice on the matter.

The IPSAS Board has been fostering a convergence between public and private sector accounting standards, although a conceptual framework that is specific to the public sector is under development by the IPSAS Board since November 2006. Since 2002 (first exposure draft issuance) through 2008 (issued Standard No. 25) and even until January 2016 with the proposed amendments to the IPSAS 25, the IPSAS Board approach to pension obligations has been close to the IFRS.

Issued in February 2008, the IPSAS 25 deals with employee benefits in general, including pension benefits. Accordingly, accounting for pension obligations is based on a dual accounting treatment that disentangles defined contribution (DC) and defined benefit (DB) schemes.

Under the IPSAS 25, there is far less accounting requirement for DC schemes than for DB schemes. In particular, less reporting is required and there is no liability inclusion for DC schemes.

This accounting treatment for DC schemes reshapes their pension obligations by establishing a "single mode of assurance through assets financial accumulation" (Le Lann 2010, p. 17). It does actually undermine accountability and responsibility of the reporting entity for ongoing and future pension obligation fulfillment, since no pension obligation is assumed to exist under this accounting treatment. In fact, the series of future contributions may represent an implicit liability under constructive obligation, but the IPSAS excludes its recognition (par. 55). Therefore, potential beneficiaries do not receive information concerning the ongoing accumulation of their contributions and the foreseeable level of pension payment that has been reached and may be sustained under the ongoing DC scheme process. They do not receive information on ongoing investment policies and their past, current, and foreseeable returns over time.

Concerning the accounting treatment for public sector DB schemes, the actuarial value of accrued future obligations is expected to be included in the liability side of the balance sheet as outstanding liability. At the same time, this treatment implies disclosure of dedicated assets, fostering the immediate funding of pension obligations, in order for cash funds to be invested, monitored, and recognized in the asset side of the balance sheet. This approach to account for DB schemes (the only ones that assure future pension obligations) is consistent with the approach endorsed by the IASB for the private sector at least since the issuance of the IAS 19 in 1998.

The US GAAP, IAS/IFRS, and IPSAS all have as a starting point that post-employment benefits should be recognized as deferred remuneration earned during the work time. Accordingly, the

paid remuneration and the unpaid part of it – that is, the pension benefit earned during the accounting period – should be recorded on accrual basis as an expense incurred in the income statement, while the earned but still unpaid part of the benefits should be recognized at the book closure date as a liability (debt) in the balance sheet. The ongoing payment of pension benefits to current recipients does not deem recognition, as for they are cash settlements of the debt (pension liability) that concern only a cash basis of accounting. No recognition or disclosure are then included in the accrual basis of accounting that is retained by these recent reforms.

### International Accounting Convergence Involves a Financialized Accounting Model

This convergence between the public and the private sector involves an accounting model that we can confidently summarize as follows: (i) pensions are understood as deferred remuneration, to be (ii) accounted through a balance sheet determination of outstanding liability, when defined benefit schemes are concerned, and (iii) measured at its discounting-based actuarial value (current value). This accounting representation somewhat implies a peculiar understanding of pension as an individual financial placement.

Accordingly, pensions are understood as deferred remuneration held on behalf of pension beneficiaries. This emergent view mingles pensions together with other financial investment funds held by individuals for precautionary or speculative reasons. An "ideal" pension fund is then supposed to be attached to each individual and transferable, when his beneficiary leaves the corporate entity that has promised his future pension payment and has been managing his pension account. Pension is then understood as an individual saving account that is supposed to stock ongoing inflows paid against accrued pension rights.

Moreover, these accumulating inflows are expected to be continuously invested over time to accumulate the final pension amount that shall be liquidated, in a form of lump sum or life rent, at a certain maturity date scheduled by the individual pension scheme. Accordingly, it is somehow the individual accumulation of cash that is expected to generate the future pension, period after period. Indeed, pension becomes a kind of financial placement at the individual level.

In this context, the accounting representation of pension obligations is expected to enact this understanding by providing actuarial information about the current net value of the joint pension fund, as if each individual were able to claim its current value pension share at will. A pension fund becomes then similar to a close monetary fund whose shares split ongoing fund current value among beneficiaries, after deduction of management fees and other corporate running costs.

Concerning the European Union, this very discussion on recognition and measurement of pension obligations has recently shifted from European national statistics to European governmental accounting and reporting. As the debate started with the European System of Accounts (ESA), it is interesting to look what has been decided at a European level with these national statistics standards. As from 2014, the ESA requires member states as employers to disclose pension liabilities as contingent liabilities while excluding them from the regular accounts of the general government sector. Under the IPSAS, disclosing pension commitments as pension liabilities on the balance sheet is mandatory. This difference between the ESA and IPSAS has a huge impact on measurements of net assets, debt, and deficit, especially when governments maintain unfunded pension schemes.

While the ESA refused to recognize unfunded pension schemes on member states' balance sheets, the future will say if the European Union follows the IPSAS 25 standard. The application of the IPSAS 25 would result in including material liabilities for public sector entities on their balance sheet. At governmental level, this will impact deficits and debts figures and thereby alter the perception of fiscal sustainability, with potential unexpected consequences on financial markets and public trust.

This actuarial accounting model fostered by international accounting convergence does not enable to depict all existing pension schemes

(section "Uncovered Variety of Existing Pension Schemes") while favoring DC in contrast to DB schemes (section "Examining the Underlying Assumption"). This accounting choice might be justified if funding and sustainability were strictly linked, which is not necessarily the case.

## The Uncovered Variety of Existing Pension Schemes and the Underlying Assumption

### Uncovered Variety of Existing Pension Schemes

This paragraph provides a review of existing practices in both the private and the public sectors. These practices are still inconsistent with the actuarial representation that has been adopted by the standards on employee benefits IAS 19 and IPSAS 25, respectively, for the private and the public sectors.

Concerning the public sector, the IPSAS 25 goes beyond current practice and regulation. The standard setter, the IPSASB (2008), candidly acknowledges in its basis for conclusion No. 17 that these requirements are inconsistent with widespread public sector practices assessing that they "may prove challenging for many public sector entities [. . .] (and) might give rise to tensions with budgetary projections and other prospective information." This further implies that the standard has been asserting a normative view which is not based upon a heuristic or comparative analysis of pension management modes.

As a matter of fact, public sector pension schemes still provide strong evidence of diversity in existing practices. IPSAS 25 is based on a dual accounting treatment that disentangles DC and DB schemes. Accounting treatment for other schemes such as multiemployers, including employers under common control, state plans, and composite social security programs, must make reference to one of these alternative treatments (see IPSAS 25, 32, 33, 25.43, and 25.47 for the public sector). The pension modes of many countries (if not nearly all) do not enter easily into one of these two allowed accounting treatments. For instance, various public administrations around the world maintain "pay-as-you-go" pension schemes where current contributors pay for other people's pension through time. Such schemes involve a collective dimension which does not correspond to any accounting treatments allowed by IPSAS 25. Hereafter, they shall be labeled "pay-as-they-go" schemes to highlight this collective dimension.

Pension schemes may be partly unfunded and provide collective guarantees and transfers that are inconsistent with the pension-saving account representation, that is, the implicit accounting model which emerges from international accounting standards. Some countries have only partially funded schemes such as the USA, Singapore, Ecuador, Canada, and Finland (Oulasvirta 2014). Moreover, some countries such as the USA, the UK, and Sweden have collective guarantee mechanisms, which can be voluntary or mandatory and concern either the private sector or the public sector.

Governmental pension funds are still largely unfunded and based upon "pay-as-they-go" schemes. Some countries such as China, Colombia, Brazil, Belgium, France, Germany, Ireland, and Luxemburg have separated unfunded schemes for civil servants' pensions.

In the European Union, few member states that grant defined benefit pension schemes (or equivalent) to civil servants/government employees recognize defined benefit pension liabilities in their statement of financial position.

According to the dual accounting distinction between DB and DC, the general opinion would suggest that French public sector pension scheme is a kind of DB, while the UK and USA apply DC schemes. The case studies of France, the UK, and the USA point out that the issue is more complex.

In France, the main schemes for public sector employees are financed on a "pay-as-they-go" basis, and no liabilities are recognized in public sector financial statements. The French pension scheme for central government employees, magistrates and military personnel, and local government employees (CNRACL) applies a "pay-as-they-go" financing method. Only, the *Retraite Additionnelle de la Fonction Publique* (RAFP), which is a complementary pension scheme for

central government employees, local government employees, and healthcare employees, applies a funded financing method.

In the UK, most major public pension funds remain unfunded, that is, no actual cash is set apart today as a cash reserve to cover for this eventual future payment. The five largest unfunded schemes, accounting for 96% of outstanding unfunded liabilities in 2009, are for the National Health System (NHS), the teachers, the civil service, the police, and the armed forces. The sixth scheme, which is funded, is the centrally guaranteed, but locally administered, Local Government Pension Scheme (LGPS).

In the USA, state governments' pension schemes are only partly pre-funded, that is, only a share of future payments are already covered by cash reserves today. At a national level, a widespread accounting practice consists in covering pension governmental funds by larger deficits in other budgetary accounts, resulting in substantially unfunded schemes. The US situation is then much more complex than is usually thought concerning the defined contribution mechanism.

Moreover, if circularity in government fundings occurs, when governmental pension funds are employed to finance other governmental entities, pension funds have little value added relative to a "pay-as-they-go" mechanism. At the present, financial reporting and disclosure do not allow to correctly examine the self-investing strategies accomplished by some public sector and private sector pension funds.

The dual distinction between DB and DC does not allow either to understand properly the notional defined contribution schemes. Despite increased individualization, notional defined contribution schemes maintain a collective dimension and are partly unfunded. In countries such as Sweden, Italy, Latvia, and Poland, public notional defined contribution accounts are maintained along with unfunded public pension liabilities. Italy and Sweden moved toward notional defined contribution pension schemes by adopting defined contribution rules while retaining a "pay-as-they-go" financial architecture.

Concerning the private sector funds, the mutual private funds and independent mutual and definite benefit pension funds are not managed as close monetary funds.

Notwithstanding changes in their accounting representation through enforcement of the IAS 19, some corporate pension funds maintain close ties with corporate sponsors, including in their investment strategies and pension operations. They may then remain substantially unfunded. Moreover, there are risks implied by self-investing: in the case of bankruptcy, self-investing strategies can be harmful as it has been the case in the UK for the Robert Maxwell's collapse and in the USA for the Enron's collapse. Self-investing remains a current practice for DC plans (named 401(k)), according to Sullivan (2004, pp. 83–84): for instance, "in 2002, Coca-Cola and General Electric had about 75% of their 401(k) plans invested in their own shares. The equivalent figure for Procter & Gamble was just under 95%."

### Examining the Underlying Assumption

International accounting convergence appears to have based upon the implicit assumption that DC schemes are "safer" than DB schemes, leading a certain favor to the former in terms of reduced reporting and disclosure.

One reason behind this favor is the alleged connection between funding and sustainability. However, funding does not necessarily imply sustainability or vice-versa. Unfunded "pay-as-they-go" pension schemes can be sustainable under certain conditions, while partially funded, financial return-based pension schemes can be and have been unsustainable in certain circumstances.

Notwithstanding discredit that has been claimed against them, unfunded "pay-as-they-go" schemes can be sustainable as long as current and future contributions from constituencies (including sponsors and future beneficiaries) go on matching current payments that become due to incumbent beneficiaries over time. From this perspective, an actuarial representation of their pension obligations can hide significant issues and hazard related with pension provision over time.

Funded schemes do not guarantee better provision and security of pensions. Shortcomings of

funded schemes have been occurring especially in the aftermath of financial crises, for instance, in the UK, in 1992, the Maxwell scandal; in 2000, the insurance company Equitable Life; and, in 2007, the pension fund of Allied Steel and Wire. In the USA, an illustrative example is offered in 2002 by the Enron bankruptcy and related scandal. In France, the additional pension fund for civil servants named *caisse complémentaire de retraite de la fonction publique* (CREF), which was partly funded, incurred financial distress and was transferred in 2002 to the COREM, a mutual complementary pension fund, under the supervision of the state. In Chile, a forerunning country in pension reforms since the 1980s, the funding requirement appears to have involved high administrative costs and low compliance rates by the Chilean pension fund administrators (AFPs).

In conclusion, an emergent normative pattern has been driving international accounting convergence for employees' benefits. It constitutes a fundamentally normative process since existing practices, especially for pension management, are still inconsistent with its requirements and underlying views. Its main consequence is to favor DC schemes over DB schemes, fostering the funding of pension funds. However, this transformation may be damageable to social welfare, since funded pension schemes are not panacea, depend on financial market returns, and involve financial investment hazard. In fact, both modes of pension management can be viable and show potential shortcomings and hazards that should be made accountable for.

Concerns were addressed on the limits and flaws of the actuarial accounting model (section "Concerns Regarding the Financialized Accounting Model") prompted by the international accounting convergence. In this context, accounting standard setting implies a delicate balance between constructing the one best practice and acknowledging alternative options that factually exist. A theoretical perspective (section "Toward a Comprehensive Accounting Representation"), applying discriminating concepts, may facilitate a better mapping of pension scheme modes and management.

## Further Thoughts for a Comprehensive Accounting Model

### Concerns Regarding the Financialized Accounting Model

Issues have been addressed especially regarding the funding of pension schemes that is clearly encouraged by the international accounting model. International organization professionals, researchers (economists and accountants), and national accounting boards have stressed limits and concerns on pension funding and pension recognition in public sector balance sheets, including throughout the public consultation process regarding the IPSAS 25. Recent reforms seem to prioritize financial sector promotion over social welfare considerations, allegedly assuming that historical patterns of retirement provision have failed and neglecting the importance of the public-private interface in financial sector development in general and in pension provision in particular.

The international accounting model has its limits. For example, it does not allow to track the flows of funds and thereby to identify DC schemes that are truly capitalized by cash funding. This undermines accountability of pension management, a dimension that is not covered by the standards. Pension management generally occurs through organized entities that perform it on behalf of sponsors and beneficiaries. This pension management is delegated to a specialized financial entity whose investment shares may not be always appropriable or transferable at will, while it may not be fully funded or liquid at every time.

From our perspective, the overarching accounting purpose concerns the protection of pension promises through enhanced reporting and disclosure. Accountability for pension management involves being accountable for the main purpose of this management, i.e., timely and continued provision of pension payments as they become due at their previously committed levels.

The pension as deferred remuneration (a sort of individual managed saving account) assures this protection through the financial accumulation process, which exposes funded pension liability to financing cost and risk, as well as investment

cost and risk, including misappropriation and misallocation by managing parties. From this perspective, its actuarial mode of accounting representation affords the danger to undermine control and accountability, as for the discounting/unwinding measurement method cannot track actual cash flows and funds that are involved in overarching managerial processes. Moreover, this actuarial representation introduces subjectivity and volatility of valuation, making ongoing valuation dependent on assumptions over critical variables concerned with the financial accumulation process, including discount rates of reference, and forecasts over very long time windows (Biondi and Boisseau 2015).

Unfunded "pay-as-they-go" model assures this protection through collective responsibility for incumbent beneficiaries, discharged by the managed entity on behalf of its constituencies. This has historically led to a lack of accounting reporting and disclosure by both public sector and private sector sponsors. Few information (if any) was provided through their accounting reporting, while no quantitative determination was included in their balance sheet concerning outstanding positions. Nevertheless, the ongoing structure of flows and funds can be represented without having recourse to current (discounted) values that are inconsistent with this model (Biondi and Boisseau 2015).

In conclusion, a clear move has been prompted to consider pension obligations as deferred remuneration, to be managed on behalf of its ultimate beneficiary through a financial investment scheme, accounted for through an actuarial basis of accounting. However, the current state of pension obligation affairs does not deliver a clear-cut, consensual view on their concept (what they are), their management (how they are fulfilled), and their accounting representation (how they are accounted for). Current practice and regulation still vary across funds, countries, and jurisdictions. The model put forward by international standard setting bodies (IASB, IPSASB) does not enable to depict all current situations while raising further issues and concerns of representation, transparency, and accountability.

On the one hand, several viable alternative management modes exist in current practice, moving from the individual saving account plans at one extreme of the pension world toward unfunded "pay-as-they-go" schemes under collective responsibility at the opposite extreme. Drawing upon this evidence, accounting standard setting may develop and enforce a set of clear and consistent accounting options which enable various existing modes to fulfill their specific accounting needs to discharge accountability and responsibility of pension management over time.

On the other hand, accounting standard setting should be concerned with relevant and material issues raised by applying actuarial measurement of pension liability based on discounting. Such a measurement proves to be particularly difficult and subjective to be performed. Moreover, it may raise wrong political incentives, since, in periods of raising interest rates, the actuarial value of pension obligations decreases. Off-balance sheet disclosure may then provide a better solution.

The following section aims at outlining a theoretical perspective that disentangles some key features of existing practice while elaborating a frame of analysis, i.e., an accounting model of reference for pension funds and flows over time. This accounting representation may allow both to see if DC funds are truly capitalized and to better grasp the specificities of the existing variety of pension management modes.

## Toward a Comprehensive Accounting Representation

Our analysis provides two main results, one concerning the variety of existing modes of pension management and the second one concerning the technical and conceptual difficulties with an actuarial representation of pension obligations, with related lack of accountability and responsibility discharges of pension management.

A theoretical perspective further shows the limits of the received opposition adopted by international accounting convergence between DB and DC schemes.

Whatever separately incorporated or not, a financial entity specialized in pension management

(generally labeled "pension fund") is purposively devoted to pension obligation fulfillment over time. This fulfillment constitutes its constitutive mission. Performing this mission involves two complementary working processes to be accounted for:

(i) One process does concern the liquidity issue and more specifically the series of cash (cash receivable and cash promised) flows that pass through the entity from ongoing contributing members (including future expected beneficiaries and committed sponsors) to incipient and future beneficiaries. This process involves cash and noncash financial funds and flows to be accounted for. It points to the financial dimension. This cash process of entity economy is consistent with a cash basis of accounting.
(ii) The other process does concern the solvency issue and more specifically the economic recovery of the outward flow of payments that are due over time to incumbent beneficiaries. This process involves recognition and measurement of ongoing payments and matching contributions, as well as dedicated assets and outstanding liabilities that are generated by ongoing management of pension entity over time and hazard. It points to the economic dimension of entity economy and is consistent with an accrual basis of accounting.

From this perspective, a deferred remuneration approach to pension involves a quite narrow view on both processes. Accordingly, each individual is expected to collect his own series of cash settlements, which, through financial placement, are the only way to get future pension payments by ongoing financial accumulation that is dependent on cumulated cash funds and proceeds. To expand on this view, it may be useful to disentangle its implicit understanding of pension management through a dualistic approach that identifies couples of contrasting terms. This dualistic approach draws upon a review of existing practices, as follows (Table 1):

**Accounting for Employee Benefits, Table 1** Couples of contrasting terms

| Dimension of reference | Discriminating concept |
|---|---|
| Economic process (contributions and expenses) | Individualistic versus collective |
| Financial process (cash inflows and outflows) | Funded versus unfunded |
| Accounting representation (accounting model) | Stock basis versus flow basis of accounting |
| Overarching definition (view, understanding) | Deferred remuneration versus social protection |

- Individualistic versus collective: this discriminating concept distinguishes between individualistic and collective approaches to pension obligations. This concept especially refers to the economic process. According to individualistic approaches, each individual is expected to pay for himself. Social solidarity through mutualistic transfers is then excluded, in principle. According to collective approaches, the whole of constituting members assure the coverage of pension payments over time. Individualistic appropriation is then excluded, in principle.
- Funded versus unfunded: this discriminating concept distinguishes between funded and unfunded pension obligations. This concept especially refers to the financial process. Under funded schemes, the pension account (s) is expected to contain cash and cash receivables to be invested to recover future pension payments. Under unfunded schemes, the pension account(s) is not expected to contain cash. It identifies outstanding pension rights and obligations that do not necessarily match some underlying financial investment process.
- Stock versus flow basis of accounting: this discriminating concept distinguishes between the two most general families of accounting models (Biondi 2012). A stock basis of accounting adopts a balance sheet accounting approach which gives priority to recognition and measurement of assets and liabilities as they stand at one point of time, to represent and account for overarching managerial processes. A current (fair) value accounting measurement is generally consistent with this stock basis. A flow basis of accounting adopts an

income statement accounting approach which gives priority to revenues, costs, contributions, and expenditures. A historical cost (historical nominal amount) accounting determination is generally consistent with this flow basis of accounting.

- Deferred remuneration versus social protection: this discriminating concept distinguishes between two alternative understandings of pension rights and obligations. On the one hand, pension is understood as deferred remuneration that is due to the individual along with the current remuneration. In its pure form, this implies that both accrued pension payment and its cash liquidation are performed in the accruing period when the current remuneration is paid. On the other hand, pension is understood as social protection that is granted by a whole of constituencies (pension fund members, citizenship) and delegated to a pension-purpose entity (mutual, governmental). In its pure form, this implies that ongoing pension payments are assured by that entity (including on behalf of sovereign powers) and do not belong to beneficiaries before they are due and liquidated.

Table 1 summarizes these couples of contrasting terms.

## Conclusion

This encyclopedia entry discusses accounting for employee benefits for private and public sector. International accounting convergence understands them as remuneration. In the case of pension benefits, they are then considered as deferred remuneration. Their actuarial basis of accounting further involves a representation in terms of individual saving accounts managed on behalf of their beneficiaries as a form of financial investment. This representation further involves an accounting gap between the defined contribution pension plans and the defined benefit pension plans, since, under the IPSAS 25 on civil servants' pension liability, defined benefit schemes recognize pension liability on the balance sheet, while defined contribution schemes do not.

This international accounting approach cannot provide consistent and comprehensive representation for the existing variety of pension schemes. In order to make various alternative and viable options comparable by users of financial reporting and disclosure, accounting standard setting may focus on supplementary disclosure of raw data on flows and funds that characterize the ongoing processes of pension management over time. A supplementary table that standardizes this basic information and schedule may be more useful, reliable, and financially stabilizing than a hazardous recourse to an ever-changing actuarial evaluation to be included in financial statements. This financial accounting solution echoes that retained for the ESA 2010, which includes a supplementary table on alternative pension systems while excluding their impact on the core accounts of the public sector.

Some have further raised the concern that recent pension policies prioritize financial market development over social welfare protection. Paraphrasing Carl von Clausewitz's aphorism on war as the continuation of politics by other means, one can wonder whether accounting is then the continuation of these financial market-favoring policies by other means. Accountability for employee benefits, especially pensions, raises fundamental issues of social welfare and protection that deserve consideration along with and prior to financial market development.

# Accounting for Infrastructures

Gorana Roje
Service for Strategic planning and Project management, Ministry of State Assets, Zagreb, Croatia

## Synonyms

Accounting for capital assets; Accounting for infrastructure assets; Accounting for infrastructure investments; Recognition and measurement of infrastructures

## Definition

Accounting for infrastructures refers to the recognition, measurement, and processing of financial information about the fundamental facilities and systems serving a country, city, or other geographic public area, including the services and facilities necessary for its economy to function. Processing of financial information refers to preparation of the financial records, the analysis, and verification and reporting of such records generally made by state, general government sector (central or local government) accounting units (such as departments, agencies, ministries). Accounting for infrastructures typically addresses recognition and measurement of technical structures such as roads, bridges, tunnels, water supply, sewers, electrical grids, and telecommunications (including internet connectivity and broadband speeds), which can be defined as "the physical components of interrelated systems providing commodities and services essential to enable, sustain, or enhance societal living conditions" (Fulmer 2009: 32), as well as assets' related expenses.

## Introduction

Governments are accountable for providing quality public services to their citizens at the most favorable terms. They are, among other issues, responsible for managing a diversified public sector asset portfolio (Grubišić et al. 2009: 329).

Infrastructure assets represent a major part of public sector asset portfolio and most often refer to basic physical systems of a nation, such as transportation, communication, sewage, water, and electric systems. These systems tend to be high-cost investments and are deemed to be vital to a country's economic development and prosperity. Thus, since they may offer significant additional benefits (known as "positive externalities"), infrastructures are often referred as "quasi-public goods" and as such they are subject to a significant number of legislative and policy restrictions with respect to its use and disposal.

In order to determine its book and economic value, infrastructure asset has to be properly recognized and valued. Recognition and measurement methods implementation provides better information about the management of public spending, because it assures better management of resources – assets and liabilities as well as costs.

Bearing in mind that public sector asset classification would enhance recognition and valuation of public sector assets and encourage professional public sector asset management development, the purpose of this entry is to address issues related to accounting (recognition and measurement) for infrastructures. The entry also addresses the infrastructure assets classification (illustrating the link

between infrastructures and other public sector fixed tangible assets), and infrastructure assets management within the public sector.

## Infrastructures and Other Public Sector Fixed Tangible Assets

Asset classification in the asset record-keeping processes is crucial to establishing a manageable asset portfolio that would be a solid base for implementing the measurement methods (criteria) necessary for efficient utilization of assets, referring to both generating future benefits and assets service potential. Bearing in mind that all nonfinancial asset items can be referred to simply as either tangible or intangible, various asset classifications are possible. The variety of classifications across countries exists because certain countries are in doubt concerning what types of assets to include in their asset portfolios and how to measure them.

Capital (noncurrent) assets have the estimated useful life beyond a single reporting period and, in the public sector, include land and land improvements, easements, buildings, vehicles, machinery and equipment, works of art and historical treasures and buildings, and infrastructure (GASB 1999). Aside from the previously mentioned, infrastructure assets have long lives and are usually stationary in nature and can normally be preserved for a significantly greater number of years than most capital assets. In addition, their longevity relates to maintenance expenses and large repairs. Examples are roads, bridges, tunnels, sewer systems, and lighting systems. Unless part of a network of infrastructure assets (such as a toll booth), buildings are not included in this category. Therefore, infrastructure assets form part of fixed assets (long-term resources), such as plants, equipment, and buildings, but they have distinctive characteristics.

Applicable to large- and small-scale organizational frameworks, infrastructure can also include a variety of systems and structures, as long as there are physical components required. For example, the electrical grid across a city, state, or country is infrastructure based on the equipment involved and the intent to provide a service to the areas it supports. Similarly, the physical cabling and components making up the data network of a company operating within a specific location are also defined as infrastructure, as they are necessary to support operations. In addition, many technical systems are often referred to as infrastructure, such as networking equipment and servers, due to the critical function they provide within certain operational environments.

Along with the aforementioned sectors, infrastructure includes waste disposal services, such as garbage pickup and local dumps. Educational and health care facilities may also be included, along with certain research and development functions and necessary training facilities. Certain administrative functions, often covered through various government agencies, are also considered part of the infrastructure.

In accordance with International Public Sector Accounting Standard (IPSAS) 17, examples of infrastructure assets include road networks, sewer systems, water and power supply systems, and communication networks (IPSASB 2016: 521). Additionally, each of those major classes comprises numerous subsystems and components that contribute to the overall operation of the asset class. Accordingly, water and sewer asset systems include the following: dams and diversion structures, pipelines, tunnels, aqueducts, canals, reservoirs, tanks, wells, pumps, mechanical and electrical equipment, buildings, electric power, and emergency equipment. Roadways include the following: pavement, bridges, tunnels, embankments, slopes, avalanche and rock shelters, retaining walls, signal and lighting systems, and maintenance facilities.

## Infrastructure Assets' Recognition and Measurement

Infrastructure assets (along with specialized military equipment) are subject to property, plant, and equipment accounting definition and treatment of public sector accounting standards. Starting from the fact that IPSAS are the only recognizable and worldwide applied standards, they represent a

sound base for asset classification and valuation rules, hence to be used to accounting and reporting for infrastructure. Infrastructure assets meet the definition of property, plant, and equipment and should be accounted for in accordance with IPSAS 17.

While there is no universally accepted definition of infrastructure assets, according to IPSAS 17, paragraph 21 (IPSASB 2016: 521), these assets usually display some or all of the following characteristics:

- They form part of a system or network.
- They are specialized in nature and do not have alternative uses.
- They are immovable.
- They may be subject to constraints on disposal.

These features typical of public domain infrastructure assets require for recognition and especially for measurement criteria that should be different from other type of tangible noncurrent assets.

According to IPSAS 17.14, the cost of an item of property, plant, and equipment, and so as to infrastructure assets, is recognized as an asset if, and only if:

- It is probable that future economic benefits or service potential associated with the item will flow to the entity
- The cost or fair value of the item can be measured reliably

In accordance to the IPSAS 17 guidance, an item of property, plant, and equipment, and so infrastructure, that qualifies for recognition as an asset shall be initially measured at its cost.

Also, an item of property, plant, and equipment may be acquired through a nonexchange transaction. Nonexchange transactions are transactions that are not exchange transactions. In a nonexchange transaction, an entity either receives value from another entity without directly giving approximately equal value in exchange, or gives value to another entity without directly receiving approximately equal value in exchange (IPSAS 23, paragraph 7, IPSASB 2006). For example, land may be contributed to a local government by a developer at no or nominal consideration, to enable the local government to develop parks, roads, and paths in the development. Where the asset is acquired through a nonexchange transaction, its cost shall be measured at its fair value as at the date of acquisition.

An asset may also be acquired through a nonexchange transaction by the exercise of powers of sequestration. Under these circumstances the cost of the item is its fair value as at the date it is acquired. If there is no market-based evidence of fair value because of the specialized nature of the item of plant and equipment, an entity may need to estimate fair value using, for example, reproduction cost, depreciated replacement cost, or the restoration cost or service units approaches (IPSAS 17, paragraph 48).

Some standard transitional provisions provide relief from the requirement to recognize all property, plant, and equipment during a 5-year transitional period. These transitional provisions refer the following (IPSAS 17, paragraphs 95–106):

- Entities are not required to recognize property, plant, and equipment for reporting periods beginning on a date within 5 years following the date of first adoption of accrual accounting in accordance with IPSAS
- An entity that adopts accrual accounting for the first time in accordance with IPSAS shall initially recognize property, plant, and equipment at cost or fair value
- For items of property, plant, and equipment that were acquired at no cost, or for a nominal cost, cost is the item's fair value as at the date of acquisition
- The entity shall recognize the effect of the initial recognition of property, plant, and equipment as an adjustment to the opening balance of accumulated surpluses or deficits for the period in which the property, plant, and equipment are initially recognized
- Prior to first application of IPSAS 17, an entity may recognize its property, plant, and equipment on a basis other than cost or fair value as defined in the standard, or may control assets that it has not recognized.

IPSAS 17. IN10 requires an entity to determine the depreciation charge separately for each significant part of an item of property, plant, and equipment. The Standard requires an entity to begin depreciating an item of property, plant, and equipment when it is available for use and to continue depreciating it until it is derecognized. Previously, IPSAS 17 did not specify when depreciation of an item began, but specified that an entity should cease depreciating an item when the item was retired from active use and was held for disposal.

According to GRAP 17. 32–79., the cost model measures assets in the reporting date, at their initial cost less accumulated depreciation and accumulated impairment losses. The revaluation model measures assets at their fair value, or replacement cost where the assets are specialized in nature, less accumulated depreciation, and accumulated impairment losses taking as reference the revaluated value. If there is an indication that an asset is impaired, an entity may need to calculate a depreciated replacement cost in determining the recoverable service amount, but only if there is an indication that an asset is impaired and such a calculation is necessary. Recoverable service amount is determined as the higher of fair value less costs to sell and value in use. If the assets are noncash generating, then value in use can be calculated using depreciated replacement cost, restoration cost, or by applying a service units approach (ASB 2010: 14–23).

An adjustment for fixed assets' life cycle is made based on periodic charges called depreciation, which may or may not reflect the loss of service potential of a fixed asset. If an asset is under contract, its useful life should not exceed the contractual obligation. Any renewal periods may be considered as long as it can be determined the government will seek and achieve the contract's renewal. Because of the specificity of the infrastructure item, its evaluation objective is often very complex: it is often not easy to evaluate the costs of purchase or to set the value in a mostly "inactive" market for such an asset item category. This further poses the question of estimating such type of assets' useful life, where depreciation depends upon accounting basis application.

GASB Statement No. 34 requires that all government entities use accrual accounting and depreciate their capital assets. In particular, GASB Statement No. 34 gives two alternatives to choose from to account for infrastructure assets:

1. Modified approach. Under this approach, GASB Statement No. 34, paragraph 23, states that infrastructure assets that are part of a network or a subsystem of a network are not required to be depreciated as long as the following two requirements are met:
   - The unit of government must manage the eligible infrastructure assets using an asset management system that has the following characteristics:
     - Have an up-to-date inventory of eligible infrastructure assets
     - Perform condition assessments of eligible infrastructure assets and summarize the results using a measurement scale
     - Estimate each year the annual amount to maintain and preserve the eligible infrastructure assets at the condition level established and disclosed by the government
   - The unit of government must document that the assets are being preserved at or above a condition level established and disclosed by the unit of government.
2. Depreciation approach. Under this approach the capitalized infrastructure assets are depreciated. Also, if a government no longer meets the requirements for using the modified approach, then the infrastructure assets must be depreciated over their estimated useful lives.

   As for costs are concerned, infrastructure assets can bear three types of costs:
   - Maintenance costs allow an asset to continue to be used during its originally established useful life. Maintenance costs are expensed in the period incurred, regardless of the amount of the expense.
   - Preservation costs are generally considered to be outlays that extend the useful life of an asset beyond its original estimated useful life but do not increase the capacity or efficiency of the asset. Preservation costs are expensed

under the modified approach and capitalized under the depreciation approach.

- Additions and improvements are capital outlays that increase the capacity or efficiency of the asset. A change in capacity increases the level of service provided by an asset. For example, additional lanes can be added to a highway or the weight capacity of a bridge could be increased. A change in efficiency maintains the same service level but at a reduced cost. For example, a heating and cooling plant could be reengineered so it produces the same temperature changes at reduced cost. The cost of additions and improvements are capitalized under both the modified and depreciation approaches to reporting infrastructure if they meet the capitalization threshold.

The depreciation can be calculated for a class of assets, a network of assets, a subsystem of a network, or individual assets. Examples of expenditures to be capitalized as infrastructure: highways and rest areas; roads, streets, curbs, gutters, sidewalks, and fire hydrants; bridges, railroads, and trestles; canals, waterways, wharf, docks, sea walls, bulkheads, and boardwalks; dams, drainage facilities; radio or television transmitting towers; electric, water, and gas (main lines, distribution lines, and tunnels); fiber optic and telephone distribution systems (between buildings); light systems (traffic, outdoor, street, etc.); signage; airport runway.

## Infrastructure Asset Management

Infrastructure asset management is a specific term of asset management focusing on physical assets. Where there is no problem of confusion, the term "asset management" is more widely used, as in the professional societies: the Asset Management Council in Australia and the Institute of Asset Management in the UK. In this context, infrastructure is a wide term denoting road and rail, water, power, etc.

Infrastructure asset management is the integrated, multidisciplinary set of strategies in sustaining public infrastructure assets such as water treatment facilities, sewer lines, roads, utility grids, bridges, and railways. Generally, the process focuses on the later stages of a facility's life cycle, specifically maintenance, rehabilitation, and replacement (National Research Council 1987).

The importance of public sector financial management reform implications on fiscal consumption is well articulated by Ball et al. (1999). Their study refers to encouraging efficient control over public resources and expenses and to strengthening the level of accountability for managing public resources proactively. Tanzi and Prakash (2000) argue that the habit of relating efficiency to public spending, as is generally done, may give wrong results when, as is often the case, public institutions use public assets (land, buildings, etc.) without imputing a cost for their use. Accrual financial reporting has been dominant among the countries involved in public sector management reforms (Hood 1991; Grubišić et al. 2009). Also, projects related to infrastructure improvements may be funded publicly, privately, or through public-private partnerships. Namely, sometimes private companies choose to invest in a country's infrastructure development as part of a business expansion effort. For example, an energy company might build pipelines and railways in a country where it wants to refine petroleum. This investment can benefit both the company and the country. In addition, infrastructure asset value tends to be less volatile than financial assets over the long term and generally provides a higher yield. As a result, some companies and individuals like to invest in infrastructure funds, such as funds involved in transportation or water infrastructure.

There are some common preconditions that are considered necessary for conducting public sector asset management activities efficiently, and these are: public assets' registry, public assets' classification, public assets' recognition and measurement, public assets' portfolio construction, institutionalization and professionalism in public asset management, and cost and outcomes measurement. These preconditions, namely public asset recognition and measurement, and cost and outcomes measurement in particular, depend on the existence and quality of the regulatory financial reporting framework (Grubišić et al. 2009: 329).

Drawing on that there is a recognized need for specialized service providers to assist entities with the preparation of their fixed asset registers. In order for the entity to make transparent and defendable decisions regarding its fixed assets, specific information must not only be available but must be presented to stakeholders in such a manner that it informs the decision-making processes. Their decisions regarding land, buildings, and infrastructure have far-reaching effects. In addition, asset management specifically uses software tools to organize and implement these strategies with the fundamental goal to preserve and extend the service life of long-term infrastructure assets that are vital underlying components in maintaining the quality of life in society and efficiency in the economy.

## Conclusion

Employing infrastructure assets to offer public services has several preconditions. The first precondition is to determine clearly types of infrastructure assets constituting the public sector asset portfolio and to determine the components of property rights that can be enforced on such assets. The classification enhances recognition and measurement of infrastructures and encourages professional infrastructure assets' management development. Making decisions regarding infrastructure assets use implies gathering data on all assets, liabilities, revenues, and expenses of a governmental unit and of the general government as a whole. Since information is the most important resource in the management process, a comprehensive accounting information and information system are crucial for public revenue and expenditure planning, performance measurement, and infrastructures management control.

# Accounting for Public Debt and Deficit

Marion Boisseau-Sierra
Université Paris-Dauphine, PSL Research University, Paris, France

## Synonyms

Borrowing; General government debt; General government deficit; Governmental accounting (GA); Maastricht debt; National accounting (NA); State debt; State deficit

## Definition

A deficit is the difference between expenditures and incomes, that is, between spending (outflows) and revenues (inflows). Deficit is deemed to be the opposite of surplus, that is, a negative balance between the two flows.

Debt is the total outstanding borrowing of an entity. Debt can be internal (owed to public and private lenders within the country) and external (owed to foreign lenders). Debt is linked to both an overall redistributive purpose (welfare policies) and the monetary base management (monetary policies) (Biondi 2016a).

Deficit and debt figures are determined through governmental accounting and national accounting systems. Deficit and debt figures are affected by (1) the specific definition of deficit or debt used; (2) the criteria used to define the scope of the accounting/reporting entity, that is, its perimeter of recognition and consolidation; and (3) the measurement methods or evaluation criteria, namely, cash or accrual basis of accounting.

## Introduction

There are two sides in the same coin. If public finance would be a coin, there would be a bright side enabling affording public goods and general welfare and a darker side with the debt and the deficit. Recently, public debt and deficit levels have been at the center of all preoccupations. However, the notion of debt is still debated and several definitions exist. As Irwin (2015) states it, "although the budget deficit and the public debt feature prominently in political debate and economic research, there is no agreement about how they should be measured." This entry will present some issues raised by accounting for debt, while the debt notion itself was further addressed by anthropologists or historians (see Graeber (2014) or Ferguson (2002)).

This entry focalizes on three levels of accounting: *budget accounting,* "subsystem to track revenue collections and the use of budgetary resources at the various stages of the spending process" (Chan and Zhang 2013, p. 2); *financial accounting*, "subsystem to recognize and measure the consequences of actual transactions and events which affect the government's finances" (Chan and Zhang 2013, p. 2); and *national statistical accounting*, subsystem often used to control for deficit and debt, to communicate, and to draw international comparisons. Each accounting subsystem has its definition, its perimeter of recognition, and its measurement criteria such as historical values or current values (Chan and Zhang 2013, p. 11).

The most frequently used and communicated debt and deficit figures are not the ones produced by governmental accounting (GA) (microlevel accounts) but the figures generated by national accounting (NA) (macro-level accounts) through national statistics. As a consequence, it is important to pay attention to the harmonization process – still far from being accomplished – that links these different but intertwined accounting processes.

This entry aims, first, to emphasize that different notions of debt and deficit exist and, second, to present some aspects of the control of deficit and debt and the institutions managing this control.

The remainder of the paper is organized in two sections. The first section will discuss some elements of the definitions of "public," "debt," and "deficit," addressing some issues raised by the accounting for public debt and deficit. The second section focuses on the control of deficits and debt and the actors in charge of this control. The links between budgeting, accounting, and statistics become critical as the control of public debt and deficit often combines measurements from the three processes.

## Presenting the Accounting of Public Debt and Deficit Definitions

### Definitions

An attempt to explore the accounting for public debt and deficit gives rise to the need to characterize the following terms: "public," "debt," and "deficit."

#### Public

Public will be in this entry treated as equivalent to general government. The term "general

government debt" is sometimes replaced by public debt, national debt, and sovereign debt. The term public debt is more used journalistically and creates the perception that this government's debt is the society's debt, involving a responsibility feeling. Chan (2008, p. 740) argues that "accounting and reporting entities (should be) defined on the basis of scope of accountability and decision-making authority." Thus government is an easier concept than public to handle for accountants.

The most commonly spread "public debt" data are the "general government debts" constructed by the International Monetary Fund (IMF) according to Government Finance Statistics (GFS). One has to keep in mind that the definition of government, its scope, and its consolidation perimeter can vary across the various modes of representation, namely, budgetary accounting, financial accounting, and national statistics. The national accounting notion of government adopted by the IMF differs from that adopted by governmental financial accounting. As specified by Chan and Zhang (2013, p. 2), "accountants tend to view government in terms of the organizations under its control, whereas economic statisticians define government in terms of its non-market functions. The government accounting literature is quite flexible, defining government narrowly as political institutions that make and enforce laws, more broadly to include public service institutions (such as nonprofit health care and educational institutions), and inclusively to cover government-owned business enterprises as well."

### Deficit

Deficit measurement differs according to the three accounting subsystem perspectives: budgeting, financial accounting, and with the national statistics. Deficit numbers are affected by (1) the definition of deficit used; (2) the criteria used to define the scope of the accounting/reporting entity, its perimeter of recognition, and consolidation; and (3) measurement methods or evaluation criteria, namely, cash or accrual basis of accounting. Accrual basis further includes historical values and mark-to-market and mark-to-model evaluation criteria. In some cases, the differences only account to inclusion or exclusion of certain transactions or events such as public employee's pensions or investments financed by public-private partnerships. In other cases, they represent these same transactions and events in a different way.

For over 20 years, the accounts of public administrations traditionally showed budget deficits.

- The commonly used accounting basis in budgeting is cash.
- For example, the last balanced state budget voted in France was in 1981.

Some countries publish several deficits. The United States, as explained by Chan and Xu (2012), publishes an actual cash deficit – prepared *ex post* by the accountants – and also the projected cash deficit, prepared *ex ante* by economists. This also happens in the context of the EU where, within the excessive deficit procedure, member states estimate a deficit and then present an actual revised deficit.

Under financial accounting, an accrual basis is adopted that represents deficit as the difference between revenues and expenses accrued to the period of reference and presented in the statement of operating or financial performance. In budgeting, a cash basis of accounting is adopted where the cash inflows and outflows become prominent. In this context, for example, focus moves from accrued expenses to incurred expenditures. As mentioned by Chan and Xu (2012, p. 69), "an important function of the budget accounting is to keep track of actual cash outlays and actual cash receipts, and the resulting actual cash deficit." Governments issue debt securities to finance (obtain cash to cover) deficit which is, under a cash basis, the excess of cash expenditures/outlays over revenue receipts, involving a cash shortage. Governments can then respond to this cash need by monetizing their deficit through refinancing debt position over time (Biondi 2013). The "monetization" is the process where the government issues debt to finance its spending and the Central Bank purchases the debt, leaving the system with an increased supply of base money (Mishkin 2009).

In national accounts, a surplus would be named "net lending" and a deficit "net borrowing."

**Accounting for Public Debt and Deficit, Fig. 1** Central government accounting standards (Source: CNOCP 2015, p. 17)

In financial accounting, consolidated financial statements are most commonly prepared under accrual basis and offer a complementary view to budgeting. Concerning the basis of accounting, the "degrees of accrual" (Chan 1998, p. 358) is fundamental in accounting for deficit and debt. In pure cash-based accounting, cash debt equals the accumulated cash deficits. The balanced equation is valid for budgetary accounting. The differences between accumulated deficit and debt arise when the definition of debt intends to be defined as held by the public. Moreover, this balanced equation generally does not hold for financial accounting. Differences occur especially when actuarial evaluation methods are adopted, because the modifications implied by these methods do not correspond to actual cash movements. In accrual-based accounting, the liability side does not correspond to the accumulated cash deficit.

To illustrate this point, "the diagram below (Fig. 1) shows the main differences in concepts between the surplus or deficit for the period determined on the basis of the general purpose financial statements (financial accounting), the budget outturn determined using the budget accounts (budgetary accounting) and the net borrowing or net lending calculated according to the national accounts (national statistics)" (CNOCP 2015, p. 16).

## Debt

Understanding conceptual issues is essential in defining debt and determining debt outstanding. Every accounting subsystem (budgetary, financial, and national accounting) provides its own definitions and classifications. The definition of these terms can also differ from country to country. Debt is to be distinguished from a liability, an obligation, a commitment, an implicit obligation, a contingent liability, a debt guarantee, a potential rescue guarantee, and a provision. For example, a liability is the responsibility to pay cash or provide service in the future as a consequence of past transactions or events, whereas an obligation is a budget accounting term and is linked to a contractual obligation. A key distinction thereby between

a liability and an obligation is that for liability to be recognized, goods and services or other considerations must have been already received, while this is not the case for an obligation.

Financial accounting standards do not use the term debt because they do not base financial accounts only on the cash dimension of transactions. Financial accounting uses "notes payable" and "bonds payable," so-called bonded debt, to stand for debt as commonly used in budgeting, public finances, and national statistics. For financial accountants, liability is the preferred term, which is a more general term than debt. Accordingly, every debt is a liability but not every liability is a debt.

The notion of public debt is an imperfect notion (Le Mestric 2005), comprising different realities – gross or net debt, consolidated or not consolidated, and cash or accrual – and will hardly be exhaustive, as "implicit debts," notion defined by Auerbach et al. (1991), such as contingent liabilities due to government insurance and guarantees, always exist but are not always accounted for.

No common definition and presentation method exist among governmental accounting standards. For example, in French governmental accounting standards (CNOCP 2015), debt is presented in the Statement of Net Assets/Equity (French name given to the central government's balance sheet) and in the Cash Flow Statement in the cash flows from financing activity (with securities issuance and the redemption of debt securities). In French governmental accounting (CNOCP 2015), the notion of debt is divided between financial debt covered by Standard 11 focusing on the accounting treatment for the sources of funding used by the central government in the course of its activity (comprising negotiable and non-securities and other borrowing) and non-financial debt covered by Standard 12 focusing on liabilities of precisely defined timing and amount, which represent the balancing entries for the different types of expense (comprising operating debt, intervention debt and prepaid revenues, and other nonfinancial debt). In the United States, several measures are available, such as the actual bonded debt and the actual total liabilities. "The American federal government has numerous financial obligations other than the much publicized 'national debt'" as recalled by Chan and Xu (2012, p. 67) comparing different measurements.

## The Difficulty and the Variety of Accounting of Public Debt and Deficits

Table 1 presents some figures of deficits and debts for France and the United States to illustrate the great variety of debt measurements relatively to the size of the overall economy as measured by the GDP.

### Financial Accounting for Deficit and Debt

An exhaustive presentation of all the different notions of debt is not feasible as different recognition principles and perimeter scopes result in varying figures of public debt and deficits in governmental financial accounting. As physical and financial investments are often accounted for assets under accrual accounting basis, the capitalization of expenditures may have substantial effects on the amount of deficit and net assets, since additional liabilities or equities must be added to match related expenditures, while the capitalized asset is generally submitted to depreciation and impairment. A fully fledged analysis of public debt should ascertain the types, amounts, timing, and degree of uncertainty of public debt and other obligations.

**Accounting for Public Debt and Deficit, Table 1** National accounting debt figures for France and the United States

| | 2012 | 2013 | 2014 |
|---|---|---|---|
| France | | | |
| Eurostat-ESA Maastricht debt | 89% | 92% | 95% |
| IMF WEO general government gross debt | 89% | 92% | 95% |
| OECD general government debt | 110% | 110% | 119% |
| United States | | | |
| US OMB federal debt held by the public | 71% | 73% | 74% |
| IMF WEO general government gross debt | 102% | 104% | 104% |
| OECD general government debt | 124% | 123% | 123% |

Sources: Eurostat, US Office of Management and Budget (OMB), OECD, IMF

In order to improve understandability and comparability, Chan (2008, p. 740) explains that "financial data should be sufficiently disaggregated to allow for flexible formation of reporting entities (and their) summary financial statements should disclose significant internal financial relationships." Due to this lack of comparability, economists and journalists base their analyses on national accounting figures, which are however not perfect either. Some authors as Jones (2003) compared the measuring and reporting of public finances from statistics and accounting perspectives. In the United States, Chan and Xu (2012) compared economic and financial accounting approaches to debt and showed comparison of figures, while Bohn (1991) analyzed the link between the budget deficits and government accounting. Bohn (1991, p. 1) also argued that "social security (being an intra-governmental activity) creates a separate class of government obligations that are enforced by political rather than contractual, market-based mechanisms." Social security in the United States is "an intragovernmental activity," as the general fund borrows from social security trust fund's cash surplus, but it is also extra-governmental activity as it provides security to society outside the governmental entities' perimeter.

### National Accounting for Deficit and Debt

National accounts aim at giving a global view on the economic and financial situation. They are neither a management tool nor a decision-making tool. National accounting is not recognition and measurement per se but more an aggregation method. Therefore, there are risks of extrapolations and of adding heterogeneous values that are not revised or harmonized.

Several points need to be clarified to better understand the debt figure considered in the national accounts: the treatment of guarantees given by government entities; the consolidation process, especially relevant for our topic; the consolidation perimeter; the consolidation of bad banks that are corporate conduits created to spin off illiquid and doubtful assets to restructure an insolvent bank under government control; and intragovernmental funds, among others.

The following example illustrates the importance of consolidation. In France, Agirc-Arrco, the French retirement supplementary fund, is included in the deficit and therefore contributes to the Maastricht deficit; however, due to their detention of public debt, its consolidation reduces the Maastricht debt level.

Another example relates to debt ratios from France, the United States, and Canada. These ratios do not only differ among sources but are also not always comparable although prepared by the same organization. The Organisation for Economic Co-operation and Development (OECD) (2011, p. 1) acknowledges that the "gross debt data (they publish) are not always comparable across countries due to different definitions or treatment of debt components." Efforts are currently undertaken to reduce differences between the various national accounting standards – e.g., the United Nations System of National Accounts (UN SNA) and the European Union European System of Accounts (EU ESA) (TFHPSA 2004). In particular, a joint initiative from the IMF and the World Bank exists to create a "Joint Public Sector Debt Statistics Database" (Dippelsman et al. 2012, p. 17). Other efforts exist to increase the convergence between national account systems and governmental accounting systems (IPSASB 2014; Lequiller 2015).

In summary, the great variety of definitions and measurements of public debt and deficit may be puzzling. Some authors, such as Shepherd (2006), Mink and Rodríguez Vives (2004), and Dippelsman et al. (2012), met the challenge and compared the different national account standards at a European or international level. Fondafip (2012), a French public finance think tank, explored all different definitions of public debt used in France.

## The Importance of Deficit and Debt Control in an Economic Governance Process

Deficit and debt measurements are involved in a "hybrid" control process that, being a top-down process, also encompasses budgeting,

governmental accounting, as well as national statistics. Some actors of deficit and debt control argue in favor of harmonizing the three different controlling modes. Currenlty, statistical data are mostly dependent from raw data from the budget. These data could be provided more by financial accounting, in the future, depending on its international harmonization process.

## Deficit and Debt in the Governance Process

### In Europe, Maastricht Criteria

The Maastricht Treaty was signed in the 7th of February 1992, and the five Maastricht criteria – or Euro convergence criteria – were introduced in 1997 in the Amsterdam Treaty in order to stabilize the Euro currency and prevent inflation risks. They are part of the Stability and Growth Pact (SGP), an agreement among the 28 EU member states to facilitate and maintain the Economic Monetary Union (EMU). Two of these criteria are of particular interest for our topic: the "deficit criterion," the deficit to GDP must not exceed 3%, and the "debt criterion," the Maastricht debt - the general government debt as defined by the Council Regulation (EC) No 3605/93 (Eurostat 1995) - must not exceed 60% of GDP. The 60% ratio was chosen because it was the level of debt to GDP of European countries when the criteria were implemented. The 3% ratio allows, in normal growth conditions, to ensure the stability of the public debt relative to GDP. If these criteria are not respected, it can lead to an excessive deficit procedure (EDP). As underlined by Mink and Rodríguez Vives (2004), both provisions - refering to expected but uncertain future payments arising from past events - , and unfunded pension schemes operated by government units for their employees are not included in the Maastricht debt, also labelled as EDP debt.

Concerning Europe, the weaknesses of the Maastricht criteria were discussed and led to some amendments of the SGP in 2005, for example, structural and conjectural components of deficit were separated. The structural component of deficit is supposed to reflect political choices in terms of public finances and independent from the conjecture. The conjectural component of deficit, as its name suggests, depends of the changes in the economic environment on gross balance "fiscal automatic stabilizers." The reform enabled the European Commission to be more accommodating with countries undertaking structural reforms. According to some economists and politicians, the growth component, neglected for a decade, needs more careful attention. Considering the debt, as the focus is only on the liability side and not on the asset side, these criteria might motivate politicians to spend less in order to reduce the debt burden of future generations. This may involve reducing growth capacity in the longer run due to the lack of public investment and spending. Jacques Delors, quoted by Le Mestric (2005, pp. 14–15), stated: "Public spending on investment have seen disproportionate reductions in Europe since the early 90s although it is perfectly healthy to finance through borrowing facilities that would benefit future generations."

One could think that the ESA debt definitions involve perfectly harmonized figures; however, differences in the statistical nomenclatures of the member states do still impact their deficit and debt figures. For example, as reported by Fondafip (2012), "Germany does not incorporate public hospitals in its national accounts whereas France does)." Political pressures were stronger than statistical standards and led to exceptions: for example, the reunification expenditure – 4% of GDP or 80 billion per year in Europe – and payments to the European budget are not accounted for. Moreover, countries can develop accounting stratagems to decrease their reported levels of deficit or debt through stock-flow adjustments (Irwin 2012; Weber 2012).

Despite some specific instances of exception and deviation, this statistically based debt level is the best existing measure to compare debts of European member states.

### In the United States

In the Unites States, under Article I Section 8 of the Constitution, only the Congress can authorize

the borrowing of money on the credit of the United States. The United States debt ceiling or debt limit is a legislative limit on the amount of national debt that can be issued by the US Treasury. The debt ceiling applies to the gross debt, which includes debt held by the public and in intragovernment accounts. The "public" here refers to all creditors other than the federal government, including foreign governments. There is a strong debate on whether a debt ceiling is an appropriate mechanism for restraining government spending (Kowalcky and LeLoup 1993; Arrow et al. 2011).

### Actors of the Control of Deficit and Debt

Parliaments, Ministries of Finances, and Statistical Offices (such as Eurostat for the European Union) are important actors of the control of public deficit and debt. In particular, the parliaments are present to assure the link between budgeting and accounting. Deficit (but also debt, in a smaller extent) lays at the heart of budget analysis: it is discussed through the government's budget bill. In recent years, efforts were conducted to increase the role for national parliaments in the public finance control (Juncker et al. 2015, p. 17).

However, in practice, the control by these actors is made difficult by the diversity of debt and deficit measures and by the existence as well of accounting gimmickry.

Koen and Van den Noord (2005), Von Hagen and Wolff (2006), and the IMF (2011) provide evidence and analysis of fiscal gimmickry and "accounting stratagems," which are occasionally covered by the media (The Economist 2012). For instance, some European central governments used currency swaps, which securitize revenues against collateralized financial instruments, to reduce the reported debt. Others classified the conduits created to rescue banks as private entities, although they were mainly financed by debt guaranteed by the government itself, in order to exclude those conduits from fiscal accounts. Central and local governments massively use public-private partnerships to lower reported levels of deficits and debts (Biondi 2016b on the UK). Local governments sometimes shifted "their" debt into governmental enterprises under their control, whose balance sheets are not consolidated in their accounts. Two cases are illustrative of the significance of the consolidation perimeter and the consolidation method: "Ireland had designed its (bank rescuing) entity as a private organization for accounting purposes, even though 95% of the costs would be funded with government-guaranteed debt. The US federal government does not recognize as its own the liabilities (or assets) of Fannie Mae and Freddie Mac" (IMF 2011).

## Conclusion

Accounting for public debt and deficit is linked to the accountability and transparency required by governmental stakeholders, including taxpayers, lenders, public employees, and their unions. Deficit and debt are certainly the main financial measures used to analyze liquidity, sustainability, and solvency issues concerning governments. A proper understanding of measurements of public debt and deficit is essential in this context. However, their measurement conundrum is neglected and has been only partially addressed by key actors and standard setters.

An excessive focus on the reduction of debt and deficit levels involves a biased and misleading understanding of the whole financing process, which stands upon the quasi-monetary nature of the debt to be employed in the provision of public services. Looking beyond the accounting aspect, one might highlight more the bright side of the coin, as for, through deficit spending and debt outstanding, governments afford providing public goods and contributing indeed to general welfare.

## Synonyms

Control method; IPSAS; National accounts; Off-balance sheet financing; Risks and rewards method

## Definition

Public-private partnership – A binding arrangement between a grantor, a public sector entity, and an operator, private or public sector entity, for the provision of an asset for providing public services by the operator on behalf of the grantor subject to the operator receiving a financial asset (financial liability of the grantor) in exchange for the service concession asset.

Concession – A binding arrangement between a grantor, a public sector entity, and an operator, private or public sector entity, for the provision of an asset for providing public services by the operator on behalf of the grantor subject to the operator receiving the right to charge the final users of the asset (deferred revenue of the grantor) in exchange for the service concession asset.

## Introduction

Public infrastructure is a necessary condition for a country's welfare and economic growth. The provision of many of this infrastructure through public-private partnership (PPP) arrangements in the early 1990s implied a redefinition of the roles of public and private sectors.

PPPs are long-term contracts between the public and private sector, where the private entity acquires or builds an asset, normally infrastructure facilities, operates it for a period according to specifications set in the contract, and, at the end of the contract, hands the asset over to the public sector. These schemes are classically described as private finance initiative (PFI) or build, operate, transfer (BOT) arrangements.

PFI is an expression used in the UK to describe PPPs whereby the private sector designs, builds, finances, and operates the assets, and the public sector pays to cover both the capital cost and services delivered by the private sector. In the literature, PFI is used interchangeably with PPPs. BOT is a PPP arrangement whereby the private sector designs, builds, and operates an asset and then transfers it to the government when the contract expires. The public sector pays for the construction of the asset and services provided with it. The main difference between PFI and BOT relates to the financing and to the construction.

There is no unanimous definition of a PPP. Depending on the country, the term PPP can cover a variety of transactions where the private sector is given the right to operate, for an extended period, a service provided by the public sector. It ranges from relatively short-term management contracts, with little or no capital expenditure, through concession contracts which may encompass the design and construction of substantial capital assets along with the provision of a range of services and the financing of the entire construction and operation, to joint ventures where the ownership of the assets is shared between the public and private sectors. In general terms, PPPs fill a space between public sector typical procurement and full privatization of a public service (IPSASB 2008, p. 8; OECD 2008, pp. 16–17).

Moreover, PPP contracts can be structured with different specifications regarding issues such as the disposition of the assets at the end of

**Note**: The views expressed are solely from the authors and do not represent the view of the institutions they work or collaborate

the contract, the required operation and maintenance of the assets during the contract, and price, quality, and volume of public services provided through those assets.

PPPs can be viewed as hybrid organizations that provide public services. Due to their relevance and, usually, large amounts involved, PPPs raise questions about value for money, affordability, accountability, and accounting by the public sector grantor (OECD 2008; Sarmento 2010; Shaoul et al. 2012).

OECD (2008, p. 133) defines *value for money* as "the optimal combination of quality, features and price, calculated over the whole of the project's life." It is normally said that public expenditure delivers value for money if there is economy, efficiency, and efficacy in the acquisition and use of public resources. While PPPs aim at maximizing the value for money relationship, whether this goal is actually achieved is open to debate and depends on each specific project and its context.

According to OECD (2008, p. 43), "a PPP project is *affordable* if the expenditure it implies for the government can be accommodated within the current levels of government expenditure and revenue and if it can also be assumed that such accommodation will be available in the future." In some cases and in the government's point of view, PPPs might be a financial vehicle to achieve a desired level of service that otherwise could not be afforded by constrained public funds. Depending on the type of contract, the government can in fact provide a service without capital expenditure.

*Accountability* is a concept with multiple meanings and has changed over time (Shaoul et al. 2012). However, this entry will consider Bovens' (2007, p. 450) definition of accountability as "a relationship between an actor and a forum in which the actor has the obligation to explain and justify his or her conduct, the forum can pose questions and pass judgement, and the actor may face consequences." Regarding the PPPs, one could suggest that accountability also encompasses showing that they deliver value for money and are affordable. Transparency and disclosure of information through the financial reporting system are paramount requirements to achieve the abovementioned accountability (Shaoul et al. 2012).

One of the reasons of the origin of PPPs was the debatable expectation of better operational and financial management by the private sector, as this is consistent with the New Public Management principles supporting the idea that private management models increase the efficiency of public sector management. However, a more likely reason for government's adoption of PPPs is related to budget constrains as they allow projects to be implemented without an immediate increase in reported spending and debt. When a government makes a direct investment in a specific public asset, the expenditure related to the investment is recognized while the project is under construction. In contrast, there are no immediate expenses or debt recorded on public sector accounts, when a PPP asset is under construction. In this case, the public costs with the asset are recorded in the long execution phase of the contract. This provides an incentive, which one calls PPP bias, to make public investments using PPP contracts as a financing instrument, because of a more favorable short run impact on public finance indicators, even if they offer less value for money, meaning they are globally more expensive than the traditional public procurement. This bias in favor of PPPs can also lead governments to assume financial commitments that later prove unaffordable under the public budget.

The last issue relates to the debate PPPs raise about public sector accounting. This entry aims to shed some light on this topic, providing a general overview of the accounting treatment of PPPs according to the national accounts framework and to the public sector financial accounting international standards. As described in the next sections, the central issue is the treatment of PPPs in the balance sheet, which can be assessed using two different methods, both discussed below: the risks and rewards method associated with the national accounts and the control method associated with financial accounting. A third method for the balance sheet treatment that differs from the above-referred binary approach where the service concession asset is on or off the government

balance sheet is the rights and obligations approach (IMF 2006) that is referred to in the last part of this entry.

This entry proceeds as follows. The next section describes the treatment of PPPs and concessions for national accounts purposes, based on risks and rewards method. Then, the financial accounting and reporting of service concessions arrangements (embracing both PPPs and concessions), on the grantor's perspective, is addressed; the control method is considered instead of the risks and rewards approach. Finally, the last section concludes with a brief discussion, in a comparative perspective.

## PPPs and Concessions

PPP accounting has been at the center of a heated debate and has changed during the last years. The accounting regulation of PPPs and concessions has evolved through the years and has been subjected to lobbying (Hodges and Mellett 2012). The main question under discussion is in which balance sheet the PPP assets should be reported and which criteria should be followed to evaluate the national accounts and financial accounting treatment (Hodges 2013).

The discussion regarding accounting for PPPs is of paramount relevance, as an inappropriate accounting system: (i) reduces fiscal transparency and hampers accountability when the assets and the related debt are off the public sector balance sheet; (ii) will not disclose fiscal risks, like contingent liabilities; and (iii) impairs the decision making process, leading to an ineffective allocation of public resources because of incentives associated with the accomplishment of fiscal targets and not with value for money of the PPPs against the public sector comparator, a device to compare PPPs with traditional public procurement. Public sector comparator is used to assess the value for money of PPPs against traditional public procurement, providing information for the decision whether to use traditional procurement or a PPP to provide public services (OECD 2008). Before taking the PPP route, a government should demonstrate that, compared with traditional procurement, a PPP delivers better value for money.

The way PPP transactions are accounted for and reported in the public sector accounts is an important factor that can either strengthen or mitigate the abovementioned bias in favor of using PPPs. Countries with pure cash accounting and reporting may underestimate fiscal costs and risks from PPP transactions, particularly during the construction phase of the public asset. In this case, the main fiscal aggregates – fiscal deficit and debt – do not fairly portray the level of risk undertaken by the public sector. Cash accounting tends to induce a bias that pushes governments to underwrite PPP contracts for reasons other rather than public interest. On the other hand, countries with more sophisticated accounting and reporting, using accounting standards like the International Public Sector Accounting Standards (IPSAS), are required to record PPPs in a way similar to other projects with public funding, and, therefore, these countries and their governments may be less exposed to such a bias, adopting PPPs as a financing instrument only in cases where such partnerships offer value for money and are affordable in the short and long term.

In this PPP context, the accounting system appears as an important tool that fosters public sector transparency and accountability. Figure 1 conceptualizes the main links.

This figure shows the positive impact of accounting and reporting under IPSAS on both PPP transparency and accountability and also the positive impact of transparency on accountability.

In PPP contracts, it is the control of the assets that determines the accounting treatment and not the legal ownership. Such accounting treatment is defined through one of two methodologies: (i) the risks and rewards method, associated with the national accounts, and (ii) the control method, associated with the international accounting standards. The following section discusses the macro accounting treatment of PPPs according to the national accounts system, and section "Financial Accounting" addresses the micro accounting treatment under IPSAS requirements, underlying the government financial accounting.

**Accounting for Public-Private Partnerships, Fig. 1** Relationships between PPP accounting and reporting, transparency, and accountability

## National Accounts

The European System of Regional and National Accounts 2010 (ESA 2010), approved by Regulation (EU) No 549/2013 of the European Parliament, and of the Council of 21 May 2013, is an internationally compatible framework for the systematic and detailed description of an economy, its components, and its relations with other economies. There are other international frameworks for national accounts that are consistent with ESA 2010, such as the System of National Accounts 2008, issued by the European Commission, International Monetary Fund, Organization for Economic Co-operation and Development, United Nations, and World Bank, or the Government Finance Statistics Manual 2014, issued by the International Monetary Fund. ESA 2010 is the framework used for budgetary monitoring, mostly of the deficit and debt, of the Member States (MS) of the European Union (Eurostat 2013). At the European level, the main reference for the statistical treatment of PPPs is the Eurostat Manual on Government Deficit and Debt (Eurostat 2016), upon which this section is based.

Since the inception of PPPs, there has been a debate on the impact of these contracts on the debt and deficit reported by the MS, more precisely the classification of PPPs on or off the public sector balance sheet.

According to ESA 2010, "PPPs are complex, long-term contracts between two units, one of which is normally a corporation (or a group of corporations, private or public) called the *operator* or partner, and the other normally a government unit called the *grantor*. PPPs involve a significant capital expenditure to create or renovate fixed assets by the corporation, which then operates and manages the assets to produce and deliver services either to the government unit or to the general public on behalf of the public unit" (Eurostat 2013, paragraph 15.41).

Unlike the financial accounting treatment discussed below, the ESA 2010 framework makes a clear distinction between concessions and PPPs. Concessions are long-term contracts (frequently 30 years or more), where the majority of the concessionaire's (public or private corporation) revenue comes from charging the final user of the asset. In contrast, concerning PPP contracts, the majority of the concessionaire's revenue comes from government payments.

In a concession contract, the concessionaire is responsible for the building, operating, and maintenance of the assets and earns revenue essentially from the users who pay user charges, such as tolls in highways.

## PPPs

A distinction was established for national accounts purposes between PPPs and concessions, which is that the statistical treatment of PPPs is based on the risk sharing by the underlying parties. For this, three categories of risk are defined: (i) "construction risk," covering events like late delivery and compliance with specifications and additional costs; (ii) "availability risk," covering volume and quality of output, i.e., the performance of the partner; and (iii) "demand risk," covering variability of demand, i.e., the effective use by end-users.

A Eurostat decision in 2004 mandates that assets involved in a PPP should be classified as nongovernmental assets – and recorded off the government balance sheet – if the private partner bears the construction risk plus at least one of the remaining two risks, either the availability or the

demand risk. In all other cases, assets are classified as government assets (Eurostat 2016). This is the "risk and reward method" for recording PPPs (OECD 2008).

This method is also incorporated in ESA 2010 requirements, and it aims at defining a criterion to allocate the assets to an institutional unit, i.e., to determine who should be considered the "economic owner" of the assets. The analysis is carried out by assessing which unit bears the majority of the risks and which unit is expected to receive the majority of the rewards from the assets. The latter is considered the "economic owner." Therefore, the allocation of risk between the public sector and the private partner is the core issue for PPPs accounting purposes. This is not the case in concession contracts, where there are no risk categories to determine the "economic owner," although general analyses of risks and rewards should be ascertained.

If the conditions for the PPP to be recognized in the partner balance sheet are met, it is also necessary to analyze the project financing and guarantees. If the financing is predominantly covered by the public sector, the government is deemed to bear the majority of risks and the asset is classified on its balance sheet. Similarly, if the public sector grants debt guarantees or assures the private partner a certain return on equity, one can conclude that the majority of risks are borne by the public sector. Financing and guarantee analyses must be carried out jointly for the evaluation of the risk distribution between the public sector and the operator.

Government may fund a PPP project to promote more competition from the private sector over these projects, to reduce the cost of capital, as interest rates on government debt instruments are lower compared to those of private sector debt instruments, or to hold the viability of the project. In situations where the assets were classified in the partner balance sheet, but during the execution phase the government increases financing to a majority level, the PPP assets must be reclassified on the government public sector balance sheet.

Thus, the risk sharing of the parties determines where the assets are recognized. When the assets are classified on the partner balance sheet, i.e., are off government balance sheet, the PPP contract has an impact on net lending/borrowing (fiscal balance surplus or deficit, respectively) over the contract duration period and not during the construction of the asset. Conversely, if the construction risk is borne by the public sector entity, or if the private partner bears only such a risk and no other, the assets are recorded in the public sector's balance sheet, with important implications for national accounts, both for government debt and net lending/borrowing. This treatment is in compliance with the accrual basis – as the work proceeds the capital expenditure is recorded as government gross fixed capital formation and debt, as in a financial lease.

Also the flows associated with the execution of the PPP contract receive specific treatment in the national accounts when the related assets are on the government balance sheet. The payments to the operator must be spread between debt redemption, imputed interest, and purchase of services, if this last component is prescribed in the contract. The latter two are considered expenses for national accounts purposes (Eurostat 2016).

### Concessions

The main characteristics of a concession are (OECD 2008, p. 23): (i) the concession grants the private entity the right to operate a specific asset and earn revenue from it; (ii) the concessionaire usually pays the public entity to obtain the right to earn revenue from the asset; (iii) the concessionaire carries the bulk of the risk; (iv) the asset remains legal property of the public sector and the private entity is responsible for the maintenance of the asset; and (v) the asset must be transferred to the public sector. Similarly to PPPs, both involve a private entity that operates, maintains, and finances the asset during the arrangement, and, at the end of the contract, the asset is transferred to the public sector.

In concessions, the main issue is to ascertain the "economic ownership" of the assets during the contract, which can be allocated either to the concessionaire or to the public sector. In short, the party considered the "economic owner" of the asset, because it was considered to bear the

majority of economic risks, should recognize the asset on its balance sheet.

For the purposes of national accounts, when the public sector is not the main purchaser of the services provided by the partner, and the main risk depends on the consumption of the services by final users, the arrangement is classified as a concession and is off the public sector balance sheet. Accordingly, in the national accounts, PPPs are distinguished from concessions by the source of revenue for the partner. The term "concession" is used to describe long-term contracts, where the majority of the partner's revenue comes from the final users of the asset. In opposition, PPPs are contractual arrangements where most of the revenue going to the partner comes from government payments.

As a practical rule, when the majority of corporation revenue comes from the final users, the asset is recorded in the corporation's balance sheet during the contract period, because the concessionaire bears most of the commercial risk (majority of economic risks), which depends both on external factors, like the demand by users, and its own performance in managing and maintaining the assets. It is possible that the concessionaire has to operate under specific government requirements and is sometimes compensated through public subsidies (Eurostat 2016).

Nevertheless, there are some situations that lead to classifying the asset on the government balance sheet. If the government is financing the majority of construction or refurbishment cost, or is providing an explicit guarantee covering more than 50% of the debt raised by the concessionaire for financing the asset, or provides a minimum revenue guarantee, the government bears the majority of risks and rewards, triggering the classification as the "economic owner", leading the asset to be classified on the government balance sheet (Eurostat 2016).

### Financial Accounting

This section describes the accounting treatment of service concession arrangements under the public sector (the grantor) perspective. The risk and reward method described above for national accounts purposes is now replaced by the control method proposed in *IPSAS 32 – Service Concession Arrangements: Grantor*, discussed below.

To be within the scope of IPSAS 32, the service concession arrangement (SCA) must legally bind the private sector operator to provide the public services on behalf of the public sector entity, using the service concession asset. IPSAS 32 covers both the concessions and PPPs cited above for national accounts purposes. Here, concessions are treated under the "grant a right to the operator" model and PPPs under the "financial liability model." Both models, as explained below, define the compensation to the operator for the service concession asset and services.

In parallel to the national accounts perspective, the fundamental issue in financial accounting is which party of the arrangement – the private sector operator or the public sector grantor – should recognize, measure, and present the assets and related liabilities (Hodges 2013).

For this purpose, a preliminary overview of the accounting standards environment will be presented. In November 2006, the International Accounting Standards Board (IASB), through the International Financial Reporting Interpretations Committee (IFRIC), issued Interpretation 12, for Service Concession Arrangements (IFRIC 12). This interpretation provides guidance on reporting the property associated with SCA that meets specified criteria related to control over such property. However, such guidance only specifically applies to private sector entities, generally the operator of the arrangement (IPSASB 2008). The disclosures for these types of arrangements are set by Interpretation 29 (SIC-29), issued by the Standard Interpretations Committee, the predecessor of IFRIC.

Aware of this caveat, the International Public Sector Accounting Standards Board (IPSASB) issued *IPSAS 32 – Service Concession Arrangements: Grantor*, in October 2011, effective for periods beginning on or after January 1, 2014. This standard is structured in paragraphs 1–37. It also encompasses two appendices, the basis for conclusions, implementation guidance, and illustrative examples. In this entry, references to IPSAS paragraphs are denoted with "par.",

references to Appendix A: Application Guidance paragraphs are stated with "AG", and references to the basis of conclusions paragraphs are denoted with "BC". This notation also applies to *Exposure Draft 43 – Service Concession Arrangements: Grantor* and to other IPSAS cited in this entry.

In contrast to the national accounts method, based on risks and rewards, under IPSAS 32 the control method was adopted to assess on which balance sheet the arrangement assets should be recorded. Although the former method can also be used for financial reporting purposes, like in the UK from 1998 to 2009 (Hodges 2013), the proposal of the IPSASB was different.

Additionally, the IMF (2006) proposed the rights and obligations method. It required a quantification of the risks and rewards the public sector was exposed to. However, such a method was considered to be an approach too complex and represented a substantial change in accounting for assets and liabilities with implications beyond SCA (IPSASB 2008, 2015, IPSAS 32 – BC 14).

### Concepts and Main Features

Like the risk and reward method, the control method is also based on the substance over form concept, meaning that the "economic ownership" of the assets prevails over their legal ownership.

The approach based on this method, which IPSAS 32 imposes on the grantor, is consistent with the IFRIC 12 requirements, which applies to the operator. This consistency is fundamental to assure that the assets associated with the SCA are recognized either on the balance sheet of the grantor or on that of the operator. This means that only one party in the arrangement recognizes the assets (e.g., infrastructure).

IPSAS 32 covers both government-funded and user-funded PPP contracts; the latter are called concessions for national accounts purposes, as explained above. A SCA is defined as a binding contract between a grantor (the public sector entity) and an operator (usually a private sector entity) in which (i) the operator uses a public asset (the service concession asset) to provide a public service for a specified period of time, on behalf of the grantor, and (ii) the operator is compensated for its services over the period of the service concession arrangement (IPSASB 2015, IPSAS 32, par. 8).

A grantor is the entity that grants the right to use the service concession asset to the operator. An operator is the entity that uses the service concession asset to provide public services, subject to the government's control of the asset.

Common features of a SCA are (IPSASB 2015, IPSAS 32, AG 3): (i) The grantor is a public sector entity. (ii) The operator is responsible for at least some of the management of the service concession asset and related services and does not merely act as an agent on behalf of the grantor. (iii) The arrangement sets the initial prices to be charged by the operator and regulates price revisions over the period of the SCA. (iv) The operator is obliged to hand over the service concession asset to the grantor, in a specified condition at the end of the period of the arrangement, for little or no incremental consideration, irrespective of which party initially financed it. (v) The arrangement is governed by a binding agreement that sets out performance standards, mechanisms for adjusting prices, and procedures for arbitrating disputes.

### Service Concession Asset Recognition and Initial Measurement

The recognition of a service concession asset is based on control for financial reporting purposes. IPSAS 32, par. 9, requires that the grantor shall recognize an asset provided by the operator and an upgrade to an existing asset of the grantor, as a service concession asset, if the following conditions are met: (i) the grantor controls or regulates what services the operator must provide with the asset, to whom it must provide them, and at what price, and (ii) the grantor controls – through ownership, beneficial entitlement, or otherwise – any significant residual interest in the asset at the end of the term of the arrangement. The residual interest is the estimated current value, at the age and condition projected at the end of the period of the SCA. For an asset used in a SCA for its entire useful life (a "whole-of-life" asset), only condition (i) needs to be met (IPSASB 2015, IPSAS 32, par. 10).

For the purpose of condition (i) above, the notion of regulation of services the operator

must provide with the asset is restricted to the binding arrangement established by the parties, excluding the general regulation powers that the government holds, in particular in some specific sectors like water or electricity management. Consequently, the general regulation powers the government holds do not represent control for financial reporting purposes (IPSASB 2015, IPSAS 32, AG8).

When the asset is not used during the entire useful life, the control criterion over the residual interest in the asset must be accomplished for the grantor recognition of a service concession asset. This type of control gives the grantor the right to prevent the operator from selling or pledging the asset during the SCA or terminating it before the term (IPSASB 2008, p. 31).

Regardless of the kind of model described in Table 1, the timing of the recognition of the underlying asset should be based on IPSAS 17 – Property, Plant, and Equipment, or IPSAS 31 – Intangible Assets (IPSASB 2015), as appropriate.

These IPSAS require that an asset shall be recognized if, and only if, the following recognition criteria are met (recognition principle):

(a) It is probable that future economic benefits or service potential associated with the item will flow to the entity (grantor).
(b) The cost or fair value of the item can be measured reliably.

Consequently, the asset can be recognized during its construction or development phase if the terms of the binding arrangement allow it to determine whether the service potential would flow to the grantor at that time and if the grantor is in possession of reliable information about the cost or fair value of the asset during that phase. IPSAS 32, AG23, gives the example of progress reports during the construction or development of the assets provided by the operator to the grantor as a source of such information.

The fair value of the asset on initial recognition is based on the type of compensation exchanged (IPSASB 2015, IPSAS 32, AG 25). Fair value is defined as "the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction" (IPSASB 2015, IPSAS 9, par. 11). In the instance where the grantor compensates the operator for the service concession asset by making payments, the fair value represents the portion of these payments related to such an asset. In the case where the grantor compensates the operator by granting the right to earn revenue from the service concession asset or another revenue-generating asset, one are in the presence of a non-monetary exchange transaction. Under the binding arrangement, the grantor obtains the service concession asset in exchange for a non-monetary asset, as it is the right of the operator to earn revenue from third-party users. IPSAS 17, par. 40, and IPSAS 31, par. 45 (IPSASB 2015), provide guidance on how to estimate the fair value of the asset received.

At the initial recognition, when the grantor recognizes a service concession asset provided by the operator, the grantor shall also recognize a liability of the same value of such an asset (IPSASB 2015, IPSAS 32, par. 15), measured at its fair value, adjusted by any consideration from the grantor to the operator or from the operator to the grantor.

Where an existing asset of the grantor is reclassified as a service concession asset because the conditions for this were met, no liability is recognized.

### Accounting for Operator Compensation

The nature of the consideration given by the grantor to the operator determines the nature of the liability recognized in the grantor balance sheet, as described below. According to IPSAS 32, par. 17 (IPSASB 2015), in exchange for the service concession asset, the grantor may compensate the operator through one of the three models summarized in Table 1.

### Model 1 Financial Liability Model

Under Model 1, the grantor records a financial liability at initial recognition. In subsequent accounting periods, the grantor recognizes, as expenses, a finance charge and a charge for maintenance and operating of the service concession asset (service component).

Under this model, the liability is a financial liability that is measured at the amortized cost

**Accounting for Public-Private Partnerships, Table 1** Models of operator compensation

| Model of compensation | Description |
|---|---|
| Financial liability model (Model 1) | Where the grantor has an unconditional obligation to pay cash or another financial asset to the operator for the construction, development, acquisition, or upgrade of a service concession asset. The payments should be allocated as a reduction of the financial liability and as a finance expense and expenses for services provided by the operator under the SCA |
| Grant of a right to the operator model (Model 2) | Where the grantor does not have an unconditional obligation to pay cash or another financial asset to the operator for the construction, development, acquisition, or upgrade of a service concession asset, but grants the operator the right to earn revenue from third-party users or another revenue-generating asset |
| Dividing the arrangement model (Model 3) | The grantor compensates the operator for the service concession asset partly by a predetermined series of payments (financial liability) and partly by exchanging the right to earn revenue from third-party use of either the service concession asset or another revenue-generating asset (granting a right to the operator) |

according to IPSAS 29 – Financial Instruments: Recognition and Measurement, par. 49 (IPSASB 2015). The operator shall recognize a financial asset of the same amount, representing the amount due from the grantor.

Accounting for a financial liability at amortized cost means that the finance charge is calculated by multiplying the outstanding financial liability at the beginning of the accounting period by the effective rate of interest. Changes in market interest rates are ignored, and, therefore, there is no subsequent measurement of the liability at the reporting date due to modifications of the market interest rates. In each reporting date, the liability is increased by the interest expense and decreased by the cash disbursement that covers the financial expense accrued and financial liability reduction. The effective interest rate is computed on initial recognition and is the rate that discounts future payments over the SCA term; the financial liability is the present value of the service concession asset component of the payments and does not include the service component of the payments (IPSASB 2015, IPSAS 32, AG 38).

If the cost of capital specific to the service concession asset is known or can be ascertained, the finance charge is based on this (IPSASB 2015, IPSAS 32, AG 40). If the cost of capital is not known, IPSAS 32, AG 41, allows the use of the grantor's incremental borrowing rate or another rate appropriate to the terms and conditions of the arrangement. The interest rate used to calculate the finance charge may not be subsequently changed unless the asset component or the whole of the arrangement is renegotiated (IPSASB 2015, IPSAS 32, AG 44).

According to this model, the grantor shall allocate the payments to the operator and account for them according to their substance as a reduction in the liability, a finance charge that was accrued to the financial liability, and charges for services provided by the operator (IPSASB 2015, IPSAS 32, par. 21).

Nevertheless, the asset and service components of the payments may be separable (e.g., the binding arrangement clearly identifies the payments that are allocated to the service concession asset) or inseparable (e.g., the binding arrangement does not identify the payments that are related to the service concession asset), and this affects the measurement of the service concession asset and corresponding financial liability. IPSAS 17 (par. 26) and IPSAS 31 (par. 31) (IPSASB 2015) require initial measurement of an asset acquired through an exchange transaction to be measured at cost, which is the transaction price, normally considered the fair value. When the payments allocated to the service concession asset (separable payments) are specifically identified under the terms of the arrangement, the fair

value is the present value of these payments. However, if the fair value of the service concession asset is lower than the present value of such payments, fair value is the one considered for initial recognition (IPSASB 2015, IPSAS 32, AG 30).

The fair value of the service concession asset is determined using estimation techniques where the asset and service component of payments by the grantor to the operator are not separable. For this, at the inception of the arrangement, payments are allocated for the service concession asset and for other components of the SCA (e.g., operations and maintenance) on the basis of their relative fair values. For example, a grantor may estimate the payments related to the asset considering the fair value of a comparable asset included in an arrangement that contains no other components or can estimate the payments for the other components by reference to a comparable arrangement and obtain the asset component of payments by deduction (IPSASB 2015, IPSAS 32, AG 32).

Where in the presence of inseparable payments, the HM Treasury Financial Reporting Manual (HM Treasury 2015) proposes a fair value approach. The fair value of the asset determines the amount to be recorded as a service concession asset and the corresponding financial liability. The total payment is then divided into three elements: the service charge, amortizing the financial liability and the interest expense on the financial liability outstanding, using the interest rate implicit in the contract. For both existing and new contracts, where it is not practicable to determine the interest rate implicit in the contract, the grantor shall use its cost of capital rate to calculate the interest expense.

### Model 2 Grant of a Right to the Operator Model

According to this model, the grantor shall recognize a liability as the unearned portion of the revenue arising from the exchange of assets between the grantor and the operator.

The grantor has received a service concession asset and public services provision, in exchange for granting the operator the right to earn revenue from third-party users of the service concession asset over the period of the arrangement or another revenue generating asset. The benefits of the grantor, embodied in the asset service potential to meet the public service objectives, are also gathered during the arrangement because the operator provides services on behalf of the grantor, leading to the application of IPSAS 9 – Revenue From Exchange Transactions (IPSASB 2015) for the nature and timing of revenue recognition (diminishing the liability). According to IFRIC 12, the operator shall recognize an intangible asset.

The consideration of the credit (balancing item) for the service concession asset, as deferred or unearned revenue (liability), needs to be further discussed, as the proposal on the *Exposure Draft 43 (ED 43) – Service Concession Arrangements: Grantor* (IPSASB 2010) intended to account for it as a performance obligation in accordance with IPSAS 19 – Provisions, Contingent Liabilities and Contingent Assets (IPSASB 2015).

In ED 43, BC 17, the liability was considered a performance obligation "because the grantor has received exchange consideration (i.e., an inflow of resources in the form of the service concession asset) in advance of its performance under the exchange (i.e., its obligation to provide the operator access to the service concession asset or another revenue-generating asset)."

Taking into consideration the comments received in response to the ED 43, the IPSASB changed its initial classification of the credit as a performance obligation, to be considered as revenue in IPSAS 32, acknowledging that the term "performance obligation" is used in relation to non-exchange transactions and a service concession arrangement is an exchange transaction (IPSASB 2015, IPSAS 32, BC 19–BC 21).

Additionally, as an argument to not consider the credit as a performance obligation, the IPSASB conceptual framework indicates that a performance obligation is "an obligation in a contract or other binding arrangement between an entity and an external party to transfer a resource to that other party" and "that obligation also arises when an entity enters into an arrangement whereby it receives a fee and, in exchange, provides to an external party access to an asset"

(IPSASB 2015, pp. 88–89). As under Model 2, the grantor has no obligation to transfer a resource or received fees from the operator, no performance obligation arises under the SCA.

The exchange of the service concession asset for the right to earn revenue from third-party users from this asset or another revenue-generating asset represents an increase in the net assets/equity as revenue. In accordance with IPSAS 9, par. 17 (IPSASB 2015), when goods are sold or services are provided in exchange for dissimilar goods or services, the exchange is regarded as a transaction that generates revenue. The service concession asset recorded by the grantor and the intangible asset (the right to earn revenue) recorded by the operator are dissimilar.

IPSAS 9, par. 17 (IPSASB 2015), also establishes that the revenue is measured at the fair value of the goods or services received, adjusted by the amount of any cash or cash equivalents transferred. When the fair value of the goods or services received cannot be reliably measured, the revenue is measured at the fair value of the goods or services foregone, adjusted by the amount of any cash or cash equivalents transferred. In a SCA, the right to earn revenue from third-party users (the asset foregone by the operator) is not recognized on the grantor's balance sheet. As a consequence, the fair value of the asset received (the service concession asset) will be more evident than the fair value of the asset foregone.

As the right granted to the operator covers the SCA period, the grantor does not record revenue from the exchange at the same time as the service concession asset is recognized. Such revenue is recorded according to the economic substance of the SCA, usually as the access to that asset is granted to the operator over the arrangement period on a straight-line basis, and the liability, the deferred revenue, is reduced as revenue is recognized (IPSASB 2015, IPSAS 32, par. 26 and AG 47).

### Model 3 Dividing the Arrangement Model

This model incorporates features of the previous two models, and it requires each part of the total liability recognized to be accounted for separately. IPSAS 29 applies to the financial liability (Model 1) and IPSAS 9 to the unearned revenue recognized as a liability (Model 2) (IPSASB 2015). So, the consideration to the operator is divided into a financial liability component (for the unconditional obligation to pay cash or another financial asset) and a liability component (for the right granted to the operator to earn revenue from third-party use of the service concession asset or another revenue-generating asset). The total liability should be equal to the amount recognized as a service concession asset.

### Subsequent Measurement and Impairment

Regarding the service concession asset, the subsequent measurement must comply with requirements of IPSAS 17 or IPSAS 31 (IPSASB 2015), as appropriate. Both of these standards state that for subsequent measurement an entity shall choose either the cost model or the revaluation model as its accounting policy.

If the grantor elects the former, the service concession asset shall be carried at its cost, less any accumulated depreciation/amortization and any accumulated impairment losses (IPSASB 2015; IPSAS 17, par. 42; and IPSAS 31, par. 73).

If the entity opts for the revaluation model, the service concession asset shall be carried at a revalued amount, which is the fair value at the date of the revaluation, less any subsequent accumulated depreciation/amortization and subsequent accumulated impairment losses (IPSASB 2015; IPSAS 17, par. 44; and IPSAS 31, par. 74). Fair value must be reliably measured and revaluations shall be made on a regular basis so that, at each reporting date, the carrying amount of the asset does not differ materially from its fair value. If there is no market-based evidence of fair value because of the specialized nature of the item, IPSAS 17, par. 48, allows the use of depreciated replacement cost or restoration cost or service units approaches as they are defined on IPSAS 21 – Impairment of Non-Cash Generating Assets. Conversely, IPSAS 31 exclusively allows the fair value to be determined by reference to an active market. The asset is also subject to impairment testing as prescribed in IPSAS 21 and IPSAS 26 – Impairment of Cash Generating Assets, as appropriate (IPSASB 2015).

The benefits that flow to the grantor from the control of the service concession asset can be future economic benefits or service potential. Many public sector assets may have a purpose to promote the availability of goods and services and not to generate cash inflows, as these assets are described as embodying service potential. Assets that are used to generate net cash inflows – or from the cash-generating unit of which the asset is a part – are described as incorporating future economic benefits.

The former types of assets are designated noncash-generating assets and the second type called cash-generating assets. A noncash-generating asset is impaired when its carrying amount exceeds its recoverable service amount, as this is the higher between fair value less the cost to sell and the noncash-generating asset value in use. A cash-generating asset is impaired when its carrying amount exceeds its recoverable amount, i.e., the higher of an asset or a cash-generating unit fair value less the cost to sell or its value in use (IPSASB 2015, IPSAS 21 and IPSAS 26).

The value in use is calculated differently for noncash-generating assets and cash-generating assets. For noncash-generating assets, value in use is the present value of the asset's remaining service potential (IPSASB 2015, IPSAS 21, par. 14). For cash-generating assets, value in use is the present value of the estimated future cash flows expected to be derived from the continuing use of an asset and from its disposal at the end of its useful life (IPSASB 2015, IPSAS 26, par. 13).

### Accounting for Guarantees and Other Commitments

In SCA, the grantor can give guarantees to the operator, like securing the debt raised to construct or develop the service concession asset (normally through a financial guarantee contract) or cover minimum revenue for the operator, by setting specific clauses in the binding arrangement.

Guarantees may be classified as financial guarantees that meet the definition of a financial guarantee contract, according to IPSAS 29 requirements. A financial guarantee contract is a contract that requires the issuer to make specified payments to reimburse the holder for a loss it incurs because a specified debtor fails to make payment when due, in accordance with the original or modified terms of a debt instrument (IPSASB 2015, IPSAS 29, par. 10).

The general rule is to account for financial guarantee contracts as financial instruments, unless an issuer elects to apply *IFRS 4 – Insurance Contracts* to such contracts, on an individual basis, complying with the conditions established in *IPSAS 28 – Financial Instruments: Presentation* and in IPSAS 29 (IPSASB 2015). Currently there is no IPSAS for insurance contracts.

To be classified as a financial liability, the guarantee provided by the grantor to secure the debt issued by the operator must be a contractual arrangement. Assets and liabilities from non-contractual arrangements do not meet the definition of financial asset or financial liability, as is the case of constructive obligations (IPSASB 2015, IPSAS 28, AG 19). The features of a contractual arrangement are (IPSASB 2015, IPSAS 28, AG 20): (i) the presence of willing parties entering into an arrangement; (ii) the terms of the contract create rights and obligations for the contractual parties, and those rights and obligations cannot result in equal performance by both parties; and (iii) the contract is enforceable by law.

At initial recognition, the financial guarantee contract is measured at fair value. If it is an exchange transaction, such value will be equal to the premium received by the guarantor. The premium will be recognized as revenue as the liability recognized at inception is amortized, in accordance with IPSAS 9 (IPSASB 2015, IPSAS 29, AG 92–AG 94).

According to IPSAS 29, par. 49, when the grantor issues a financial guarantee contract with an embedded commitment to repay the debt raised by the operator in the case of default, the grantor measures the contract at the higher value of (i) the amount determined in accordance with IPSAS 19, par. 44, and (ii) the premium received less cumulative amortization recognized as revenue (IPSASB 2015).

If a financial guarantee contract is issued through a non-exchange transaction, without commercial purposes, with the consideration

received not representing the fair value of the financial guarantee contract because there is no consideration or it is an insignificant amount, at initial recognition the first step is to try to make a reliable measure of fair value. The entity first considers if an active market exists with quoted prices for similar financial guarantee contracts. In the inexistence of an active market, a valuation technique, which considers all the facts and circumstances, including the financial risk surrounding the transaction, should be used to obtain a reliable estimate of the fair value (IPSASB 2015, IPSAS 29, AG 95–AG 96).

Without a reliable measure of fair value, either by the observation of quoted prices in an active market or by a valuation technique, at initial recognition the requirements of IPSAS 19, par. 44 should be applied, as well as IPSAS 19 for subsequent measurement.

Guarantees and other commitments that do not meet the definition of a financial guarantee contract in IPSAS 29, par. 10, like constructive obligations, should be treated according to the requirements of IPSAS 19 – Provisions, Contingent Liabilities, and Contingent Assets. Also performance guarantees, like minimum revenue threshold or minimum return on investment by the operator, should be treated in accordance with IPSAS 19 (IPSASB 2015).

Finally, according to IPSAS 19, par. 22, a provision should be recognized when (i) an entity has a present obligation (legal or constructive) as a result of a past event, (ii) it is probable that an outflow of resources embodying economic benefits or service potential will be required to settle the obligation, and (iii) a reliable estimate can be made of the amount of the obligation. The measurement of the provision shall be made according to the best estimate of the expenditure required to settle the present obligation at the reporting date.

The disclosure of financial guarantee contracts under IPSAS 30 – Financial Instruments: Disclosures – shall display a maturity analysis. For contracts issued through a non-exchange transaction, where no fair value can be ascertained and a provision is recognized, the circumstances that led to this recognition should be disclosed (IPSASB 2015).

### Accounting for Other Revenues

SCA can also generate revenues for the grantor through revenue-sharing provisions in the binding arrangement, upfront payments, or payments in installments, from the operator, to enter the arrangement.

The grantor should recognize revenue and related receivables generated by revenue-sharing provisions as it is earned, in accordance with the requirements of IPSAS 9 for royalties. Par. 34 stipulates that revenue from royalties shall be recognized as they are earned in accordance with the substance of the relevant agreement (IPSASB 2015).

For the revenue associated with upfront payments, or payments in installments, from the operator to the grantor, the straight-line method should be used or another method that better reflects the underlying economic consumption of its access to the service concession asset, considering the criteria on IPSAS 9. Any consideration received from the operator in advance of the grantor's performance should be reported as a liability until it is earned.

### Presentation and Disclosure of Service Concession Arrangements

For presentation of the service concession asset, the grantor shall comply with *IPSAS 1 – Presentation of Financial Statements* – and present it as a noncurrent asset having the possibility to present it in a separate line, applying IPSAS 1, par. 89 (IPSASB 2015). Disclosure about the SCA occurs in the notes to the financial statements.

IPSAS 1, par. 127, states which notes contain information in addition to that presented in the statement of financial position, statement of financial performance, statement of changes in net assets/equity, and cash flow statement (IPSASB 2015).

For SCA, a non-exhaustive list of disclosures must provide a description of the arrangement, significant terms that may affect the amount, timing, and certainty of future cash flows; rights and obligations associated with the arrangement, termination, and renewal clauses; and change in the arrangement during the reporting period (further details in IPSASB 2015, IPSAS 32, par.

31–32). Other standards may apply to SCA disclosures, which, for the sake of parsimony, will not be discussed in this entry.

### Transition Requirements to IPSAS 32

Some public sector entities may have ongoing SCA and need to comply with the requirements of IPSAS 32, like the Portuguese case, where a new accounting framework mostly based on IPSAS for financial accounting and reporting purposes was passed in September 2015. In such a situation, the requirements of IPSAS 33 – First-Time Adoption of Accrual Basis IPSAS must be applied (IPSASB 2015).

The main issue in the transition between accounting frameworks resides in the initial measurement of the service concession asset and related liability, under Models 1 and 2 discussed above.

Where a grantor has not recognized assets and liabilities of SCA under the previous accounting framework, it is not required to recognize and measure these assets and liabilities for reporting periods beginning on a date within 3 years following the date of adoption of IPSAS. These financial statements that adopt transitional exemptions identified in IPSAS 33 are qualified as "transition IPSAS financial statements" (IPSAS 33, par. 13). IPSAS 33 has a transitional period of 3 years to recognize and measure certain types of assets and liabilities, because it is assumed that it takes time to adapt processes and gather information. Following the date of adoption, there is a transition period of 3 years (transition IPSAS financial statements), and afterwards, the entity has to comply with all IPSAS requirements, and the financial statements thereon are called "first IPSAS financial statements."

When reliable cost information of the service concession asset is not available, the grantor can use fair value as the deemed cost. IPSAS 33, par. 9, defines deemed cost as an amount used as a surrogate for the acquisition cost or depreciated cost at a given date.

Where the deemed cost was considered, the grantor shall measure the liability under the financial liability model (Model 1) as the remaining contractual cash flows specified in the arrangement and considers the interest rate prescribed in IPSAS 32 (AG40–AG45) to determine the finance charge to be accrued to the outstanding financial liability. Under the right to the operator model (Model 2), the liability is measured as the fair value of the asset less any outstanding financial liabilities, adjusted to reflect the remaining period of the service concession arrangement (IPSASB 2015).

Subsequent depreciation or amortization is based on the deemed cost and starts from the date of adoption of IPSAS 32 (IPSASB 2015, IPSAS 33, par. 65).

## Conclusion

PPPs are an alternative to traditional public procurement, in order to have access to assets that are necessary to provide public services, like transportation, health, and sewage. Their advent, and recent spread in countries like Portugal, entails questions associated with delivering accountability, value for money, affordability, and accounting.

Concerning the latter, the accounting treatment of PPPs should not drive the decision of governments toward this type of public investment. The driver should be the efficiency gains associated with this arrangement when compared with traditional public procurement and service delivery.

As this entry has shown, under IPSAS 32 and other related IPSAS, the impact of a PPP on the main fiscal aggregates is similar to that of traditional public procurement, because the latter is accounted for according to the requirements of IPSAS 17 or IPSAS 31. Under IPSAS, assets, debt, and deficit indicators will all increase as the PPP asset is constructed like in traditional procurement. This is a major improvement in government accountability, since it prevents PPP-related assets and corresponding liabilities from being treated off the government's balance sheet.

Despite the importance of accounting to record these arrangements properly, it is not a straightforward issue because of the complexity and diversity of the underlying contracts.

The public sector accounting international environment highlights two concurrent methods to

recognize PPP contracts: the risks and reward method, for national accounting reporting, and the control method, for financial reporting. From an information user point of view, more convergence between national accounts and financial accounting in the public sector is desirable regarding this matter.

With the expected increased adoption of the control method in public sector accounts, one expects new accounting issues will ensue, regarding recognition, measurement, impairment, presentation, and disclosure of these arrangements.

# Accounting of Hybrid Organizations

Enrico Bracci
Department of Economics and Management, University of Ferrara, Ferrara, Italy

## Synonyms

Hybrid organization; Public service reforms

## Introduction: Hybridity in Public Organizations

The concept of hybrid organization is widely used and discussed in several fields of research, such as economics, organization studies, management, public administration, law, and political science. More recently, the accounting studies increased the attention and the number of papers. Despite

the interdisciplinary interest, the concept does not seem to have a unique agreed definition. It is therefore relevant to make a clear distinction on its meaning, as well as consequences, problems, and solutions in the context of public organizations. In doing so, the focus here will be brought to how accounting is involved in the process of hybridization and the management of hybrid organizations.

Hybridity is a multidimensional concept and can be referred to multiple levels. It is possible to observe hybrid forms either at the macro level (national or supranational), meso level (organization), or micro level (individuals or groups). Those levels need to be considered in their interrelation, since focusing on just one of the three may be too limited. Much of the literature is focused on the meso level in order to provide a definition of hybrid organization. The concept of hybrid organization can be considered an umbrella term, without a clear demarcation of what is a hybrid or what is not, and how an organization, an individual, or a technology can become a hybrid (Denis et al. 2015). Transaction cost economics (TCE) offered one of the first definitions of hybrid forms of economic governance. Williamsons (1996) distinguished three forms of discrete governance mechanism: market, hierarchies, and the hybrid intermediate form. The main critique to this approach is that by occupying the continuum between the two ideal forms, most of the existing organizational forms can be considered a hybrid, from subcontracting to cooperative and from networks of organizations to alliances. As a consequence, hybridity could not be considered a discrete form of organization but a wide range of different combinations. The classical organizational forms of market (e.g., firms) and hierarchies (e.g., public sector organizations) seem to be residual and not sufficient to theoretically explain the way in which public services are nowadays designed, delivered, and made accountable. We are now observing public services coproduced by the users, delivered through a network of actors or through forms of public-private partnership, joined-up governments, in which lateral/horizontal interorganizational processes are developed. Hybrids are fundamentally different from market and hierarchical forms, and such differences impact inevitably on the coordination and controlling mechanism, as well as in their accountability.

The public management literature attempted to overcome this limitation in different ways. From one side, an attempt was made to identify a discrete form of hybrid organization. As an example Koppell considered hybrids as organizational forms that deliver public policy, but with a corporate status. The combination of public policy and corporate status leads to the development of hybrid organizations that are thus clearly visible and manageable (Koppell 2003). A different approach considered the TCE categories of market/hierarchies/hybrids and translated them into government/business/not for profit. Hybrid organizations, according to the proposers, are the result of any combination among two or more of the basic forms leading to a wide array of possible outcome of the process. This last approach was specifically developed by theorist in dealing with complex societal issue, such as social care (Evers 2005). On a similar vein, Battilana and Lee (2014) argued that hybrid organizations combine multiple organizational forms, experiencing unique organizing challenges in public services and policy.

This latter approaches are particularly useful in the context of public services, due to the continuing reform processes that led to changes in the traditional public administration, taking elements coming from the New Public Management (NPM) (Hood 1991) and/or New Public Governance (NPG) (Osborne 2006) waves (see Table 1). NPM-inspired reforms were, and to some extent still are, based on the belief of the failure of traditional public administration to deliver efficiently and effectively the promised services. The consequences were the privatization of several public services and the adoption by public organization of corporate features in order to create more autonomous, flexible, efficient, and effective organizations. NPM is primarily based on a vertical and hierarchical view and concentrated on the outputs of individual organizations (result orientation). NPM considers the market or quasi-market relation between the provider and

**Accounting of Hybrid Organizations, Table 1** New public management and new public governance and related hybrids

the client as the main solution of the traditional public organization problems. Where privatization is not possible or feasible, then public organizations should adopt corporate solutions in terms of management solutions. Hierarchical control of the results of single organizations through performance indicators on efficiency and effectiveness is a standard set of accounting techniques under NPM. In such contexts, if the client is not satisfied with the service, the main mechanism of the relationship would be to exit. As a consequence of that, most of public services in several countries are nowadays delivered in forms that are neither market nor hierarchies: agencies, public-owned corporations, and public-private partnerships are examples of the hybridizing process of public organizations.

On the other hand, NPG, while counterweighting the limits of NPM in achieving its aims, put emphasis on the role of cooperation between public administration and the wider set of actors within the society. NPG considers the limitations of the state, market, and society to solve complex issues. On these perspectives, public sector organizations should pay attention to the means through which resources, competences, and skills can be pooled in order to plan, design, and deliver a more effective and efficient set of services. Voluntary and not-for-profit organizations, individual and groups of citizens, and other public and private actors are considered resources to be steered and pooled in order to create public value in the delivery of public services. NPG aims at building a cooperative environment, based on lateral relations and with a focus on the outcomes to be achieved through collaboration. The control systems tend to be enabling through dialogue-driven systems of performance indicators, strengthening the contribution of single organizations/individual to the overall performance. Coproduction, joined-up governments, and networks of public and private organizations are additional examples of hybridizing process under NPG logic and where the relationships tend to endure by adopting more voice and trust as relational mechanisms.

Hybridity is, thus, not the problem, since hybrid organizations appear to be quite the norm, rather than the exception. What is relevant and attracts the interest of researchers are the process of becoming a hybrid with the struggles, ambiguity, tensions, compromises, and the role of different actors and technologies deployed. The ambiguity in hybrid organizations is related to the combination of public and private characteristics and objectives which may be diverse and contradictory (Kickert 2001). Besides, the mixed private and public interests entail the presence of a wider range of stakeholders, making more complex the governance and the decision-making process. Hybrid organizations are, for instance, criticized for the lack of accountability and transparency and for problems in securing liabilities. Hybridity problematizes the organizational boundaries, in physical, technological, and cultural aspects. The traditional institutional boundaries are therefore put under question in a process of hybridization of knowledge, identity, rules, technologies, and structures. It is not surprising that in public management literature, the hybridity theme was studied in a varied array of theoretical perspectives: from governance theory to actor network theory and from institutional theory to cultural theory, just to name a few. Such theoretical borrowing allowed to have a better understanding, not just

of why hybrid exists, but on the process of hybridization both at the macro, meso, and micro level.

## Perspectives on Accounting in Hybrid Organizations

The typified forms of economic governance of market and hierarchy are closely related to accounting. Indeed, accounting can make visible or invisible certain things, through calculation. It provides financial and nonfinancial information to coordinate and control the organizational activities. It is not surprising that accounting is also considered a relevant technology in hybridization and the management of hybrids. Hopwood (1996) urged accounting scholars to look at the lateral flow of accounting information, not just at the traditional hierarchical vertical flow of information. This intuition led to the development of a stream of literature looking at the accounting practices at the margins, on how they are implicated in the management and control of relations beyond the boundaries of organizations. On a similar manner, Otley et al. (1995), while stressing the limitation of management accounting research in focusing only in a functionalistic and hierarchical view of organizations, argued that such focus was not coherent with the development of new organizational forms.

Accounting in hybrid organizations can be analyzed in two perspectives, an internal and an external, reflecting, respectively, the management accounting and financial accounting divide. The latter perspective is related more generally to the theme of accountability. Accountability systems define the answer to some simple questions: who is accountable? To whom? For what? And by what means? Traditional accountability mechanisms tend to fit with the traditional public organizations characterized by vertical/hierarchical relations. Vertical accountability, with financial reporting as typical example, does not allow to make hybrid organization fully accountable. Vertical accountability mechanisms need to be integrated with horizontal accountabilities, particularly where hybrid organizations are dealing with wicked and/or tame problems (Hodges 2012). Accountability arrangements in hybrids present special concerns because of the potential for accountability to get "lost in the cracks of horizontal and hybrid governance" (Romzek et al. 2012, p. 443). The traditional hierarchical structure of accountability is not coherent with the new hybrid forms of public service organization and delivery. In the age of network, joined-up government and PPP/PFI initiative public officials are required to move outside the hierarchical structure of government searching for collaboration, quasi-market relationships with contractors, competitors, and coproducers (Considine 2002). Where co-responsibility and cross-collaboration prevail in the delivery of public services, accountability becomes a structural contingency problem. The accounting and accountability systems need to adapt constantly to reflect the actual conditions of hybrids. As the way in which public services are delivered become more complex, involving several agents and principals, accountability goes through process of change (evolutionary or adaptive) or even crisis (Considine 2002). As stressed by Kickert (2001), the dilution of accountability and the lack of transparency of the results and the use of public money are two main concern related to the increasing presence of hybrid organization in delivery public services and/or policies.

The internal perspective of accounting is concerned with the management accounting. Management control systems are implicated in the measurement and management of tasks, risks, and economic flow in a multiactor network, to diffuse and establish trust and associated information requirements among actors. As Hopwood (2009, p. 801) explained, "management accounting research gives little or no guidance on the modes of organizational response to economic crises," which is all the more true in the context of public service organizations. The crisis of public finance is leading to the development of hybrid forms of organizations in order to pool resources from both the public sector and the private sector. It represents an interesting context for providing a better understanding of the unique functioning of management accounting practices, such as budgeting, cost control, performance

measurement, and incentive systems (Arnaboldi et al. 2015). The nature of management accounting practices means that they can provide information on the day-to-day decisions being made inside organizations, but they also have the ability to influence significantly on governance and accountability arrangements at the societal level. The overriding question in this respect is how they are skillfully reconfigured (in terms of scale and the kinds of activities they are used for) to effectively remedy the situation. The study of the interrelations between management accounting and organizational changes, although not new (Broadbent and Guthrie 2008), will continue to represent an important field of observation, since the hybridization of public sector organizations involves some form of organizational change. Probably more than in other periods, there are a large number of public service organizations undergoing radical changes combining public and private elements (Broadbent and Guthrie 2008). Existing dynamics will continue, in terms of growing role of interorganizational relations, complex governance and network structures, and public and private organizations joining up in order to cope with complex (wicked) problems and declining resources (Jacobs and Cuganesan 2014). In such hybrid context, management accounting has the function to support the coordination and the control within and outside organizational boundaries and to build the trust among the different actors.

In the last two decades of public sector reforms, accounting was diffusely mobilized in order to foster or trigger the organizational change (Broadbent and Guthrie 2008). At the macro level, the process of reforming accounting technologies in terms of financial reporting, management accounting, and audit, particularly in the NPM era, was observed. As an example, the shift from the traditional cash accounting to the accrual accounting, by adopting IPSAS or similar national accounting standards, was introduced on the faith of the superiority of the business-like accounting tools. However, the implementation in public organization of accrual accounting was not linear, nor without tensions and compromises, with some successes and failure. We have now example of traditional public sector organizations like local authorities, universities, or hospital using corporate management tools like accrual accounting, budgeting, performance measurement systems, internal audit procedures, and discussing about corporate plan, strategic plan, and deployment. Hybridizing at this level may also become a policy objective. The so-called regulatory hybrids (Kurunmäki and Miller 2011) are the explicit target of government policy creating new organizational forms to deliver public services and programs.

At the meso level, accounting was considered at the organizational level attempting to observe the way in which accounting was used and changed. Each organization may be transformed and hybridized as organizational boundaries are shaped and transformed. In hybrid organization boundaries tend to be blurred, requiring new forms of control and coordination. Measuring, controlling, and being accountable across boundaries are central elements in hybrid forms of organizing public services. In the case of hybrid forms of governance, accounting has a claimed role of building trust among the actors involved, as well as its extension may be affected by the level of trust existing in the complex organization. In many accounting procedures, trust is obviously implicit, but the relationship between the two cannot be considered monotonic. There are different types of accounting information involved, some more related to continuous processes of relation and some related to specific events. The relationship between trust and accounting is correlated and in which the least level of trust is associated with a higher intensity of accounting information. Accounting information is thus implicated in the management across the boundaries in hybrid forms of organizations. Llewellyn (1994, p. 10) problematized the idea of organizations arguing that any organization "has to be achieved" through boundary management. Boundaries can be used and work as a threshold between what is within and outside and as a binding structure to create an internal unity of what is within. Accounting is involved in the constitutive role of producing the hybrid organization. The organizational consequences in conceptualizing

the boundary work is that boundaries are socially constructed and they are evolving over time rather than taken for granted. Accounting can be considered as a practice that is influenced by the organizational boundaries (Otley et al. 1995), but at the same time is implicated in shaping them (Llewellyn 1994). Indeed, boundaries can be established as thresholds and/or as binding structures with accounting heavily implicated in this processes.

At the micro level, single or group actors take the stage. Hybrids have an impact on individual actors: medical professions, social workers, teachers, nurses, and many others are nowadays forced and/or encouraged to learn and use an increasing amount of accounting knowledge and tools, generating new forms of expertise (Kurunmäki and Miller 2006). Within an organization not all individual actors may accept the hybridization of their role and resist in some way or another. Such situations will produce a polarization in which some actors accept to hybridize their role, while others continue refusing the new knowledge and/or technology coming from a different source of legitimation (Jacobs 2005). Accounting in hybrid organizations does not necessarily mean that a more complex or different set of technologies and tools are necessary. The same accounting concept can be applied, or accounting can go through a process of change, becoming itself a form of hybrid. The hybridization of accounting is a relevant research theme, in order to understand how new accounting hybrids emerge by the combination of different sources of knowledge and culture. Accounting in this process changes in order for the actors to make sense of the reality they observe. At the same time, accountants become hybridized affected by knowledge coming from other disciplines and using new technologies. For instance, enterprise resource planning (ERP) system was considered an example of technical device and knowledge coming from different disciplines changing the accountants' practices, role, and expertise (Caglio 2003). The direction of hybridization between accountants/accounting and other professional groups is not predictable, nor are the consequences.

## Concluding Thoughts

Nowadays, most of public services are delivered through hybrid organizational forms, at least in developed countries (Broadbent and Guthrie 2008). The post-NPM and austerity-driven policies don't show path of decreasing their grip to this trend in the near future (Bracci et al. 2015). The understanding of how accounting is implicated in the management of hybrid organization will represent a focal theme of interest for practitioners and researchers alike.

While the definition of what is a hybrid organization will continue to remain debated, its operational consequences will need to be developed through the use of different theoretical perspectives (Skelcher and Smith 2014). Given the multidimensionality of the concept and the diversity of knowledge and skills involved, the role of interdisciplinary research is fundamental to untangle the complexity of the issues. Besides, the macro, meso, and micro levels need to be taken into account, to achieve a comprehensive view of ongoing process of hybridization and change in public services. As Evers (2005) argued, most of the hybrid governance systems in welfare services are not the result of a clear strategy but the muddling through of organizations and actors under conditions of uncertainty.

Accounting in hybrid organizations can be analyzed and studied in two interrelated aspects. From the one side, the binding of organizations and the definition of thresholds represent the two manners in which accounting can be part of the hybridization of an organization and/or a profession. Accounting is implicated in the maintenance, destruction, and shaping of new boundaries in hybrid organizations. The role of accounting in the management of boundaries is crucial both in its internal and external perspectives, in order to support the adequate level of control and accountability. Besides, it is possible to observe several cases in which accounting was involved in the hybridization of a profession, such as physicians or nurses. Integration, collaboration, and joint efforts are central in the public organization ecosystem. In doing so, accounting needs to move from a hierarchical coordination

approach and vertical information flows, to a more horizontal coordination approach with the management of lateral information flows.

On the other hand, accounting technologies when encountering new knowledge and competences may become hybrids on their own. Non-accountants when using accounting may shape it, adding new knowledge and transforming accounting itself. The case of accountant meeting engineering and/or medical knowledge is a clear example of cases in which the accounting solutions evolve in manners that are now feasible beforehand (Hopwood 1996; Miller et al. 2008). However, what is not fully clear is the learning process involved and the factors fostering or triggering the hybridization, which requires additional research effort. Accounting in hybrid organizations will continue to be enriched by the knowledge coming from the fields it encounters, shaping the development path of the research, profession, and education.

## Synonyms

Accounting frameworks; Models; Principles; Qualitative characteristics for good public sector accounting

## Introduction

The traditional purpose of accounting in the public sector is to enable budget follow-up and confirm that the accountable government entities have used their budget money legally and accordingly to the binding budget. This is why **budget-linked budgetary accounting** is the core area of public sector accounting. The primary statement of budgetary accounting is the budget outturn statement. This statement may be disclosed for the whole budget, then separately for the current and capital budget, and, furthermore, for different sectoral functional areas inside the budget. There are big variations across countries on how budgets are structured and presented. The essential thing is that this way of formulating and presenting **the budget determines the account scheme** for the budgetary accounting and outturn reporting.

The other essential matter is that public sector entities publish (or should publish) their budgets as well as their outturn reports. **Budget publicity principle** serves the public as well as the legislative bodies that have the sovereign decision-making power. So, **the primary users** of public sector budgetary accounting information are the budget decision-maker (parliament, local councils, etc.) and its elected members representing in a democracy the ultimate principals, voters, and resource providers (taxpayers) for the budget.

Information about compliance with budgets is much more essential than in the private business sector. In the case of public sector entities, the accountability is concentrated primarily on the use of budget appropriations and on the goods and services provided and effects achieved from "value for tax money" point of view. Discharge of such accountability is evaluated on the basis of budget outturn statements and activity performance reporting. This activity-based performance reporting uses besides financial information also nonfinancial information, for instance, data about the quality and amount of services provided and the cost-effectiveness of operations. Hence, the discharge of accountability is not possible to be evaluated on the grounds of general-purpose financial statements (the statements of financial performance and financial position) alone, even if they give useful information about the public sector entity's economy, such as the surplus or deficit for the period and its assets and liabilities (or indebtedness). The **accountability** of public sector entities consists of **both financial and non-financial performance** goals and responsibilities. The overall performance can be assessed only when these two dimensions are examined simultaneously.

## The Character and Modes of Public Sector Financial Accounting

There are three basic characteristics that differentiate public sector entities from business entities; these are:

1. They do not have owners that require profit for their capital investment.

2. They do not have a real revenue-earning process in the market, but they rely mainly on tax financing.
3. Their goals are related to societal goals that cannot be disentangled with the financial accounting method (Falkman 1997).

Budget-led accounting has historically been developed in German-speaking countries under the concept **cameral accounting**. The basic simple variant of cameral accounting uses in bookkeeping the **single-entry method**, while accrual accounting following either entity theory or proprietary theory as well as the funds theory of accounting uses all **double-entry** bookkeeping methods. Cameral accounting was developed for the core administrative public sector, and over time it was developed from registering only realized revenues and expenditures (cash accounting) to also incorporate future revenues and expenditures caused by payment obligations (current due accounting representing modified cash basis) (Monsen 2002).

The **funds theory** of accounting has also put some traits on public accounting. Funds theory has a focus on the service potential of assets, not on their income earning capacity. Assets are acquired in order to contribute to increased service production, from which the users benefit. This means that assets are not acquired in order to earn profit; neither the profit is seen as belonging to the proprietor (the proprietary theory) nor to the organization itself (the entity theory). From these starting points, fund theory of accounting is more applicable in the government sector than the proprietary and entity theories. The fund theory expresses a balance equation of assets = restrictions on assets, which suites well to the budget-linked governmental accounting, in which budgetary decisions represent the authority to use and receive money and also restrictions on assets. Local government entities use typically a general fund and several special funds. In an Anglo-American tradition of public sector accounting, fund accounting has been used especially in the USA and UK (Monsen 2014).

This different context and difference in defining the primary users of information mean that financial accounting has developed differently in the government sector than in the private sector. The accountability of budget money usage has meant that accounting has for long been cash based or modified cash based showing how authorizations to use budget money have been accomplished.

However, because budgetary accounting follows the rules of allocating incomes and expenditures into the budget, the more budgeting complies with rules of accrual accounting, the more the budgetary accounting is at the same time double-entry accrual-based accounting. It is a common misunderstanding that government budgetary accounting is cash-based accounting, while in reality it often varies from pure cash-based accounting to modified cash-based or modified accruals-based accounting.

As mentioned, the **link between budgeting and accounting** forms a basic feature of governmental accounting. The more new public management ideas have been introduced to the public sector financial management, the more popular the accruals-based accounting has become in the public sector. However, in some countries, accruals-based accounting has been established besides the traditional budgetary accounting that has remained mainly on modified cash basis. In these countries, public sector organizations use a double system of public accounting: separate budgetary accounting that purports to present the budget-outturn calculations and separate accrual financial accounting that purports to present general-purpose financial statements (income statements and complete balance sheets). Recording to both financial accounts and budgetary accounts may happen simultaneously inside one combined information system. Information technologies with sophisticated software allow the integration of these two subsystems. Budget entities may also carry out a reconciliation between accrual accounting and budgetary accounting (Brusca et al. 2015).

If the budgetary accounting and the financial accounting are on the same basis, these two accounting systems can be merged into one serving both budget reporting and financial statement reporting purposes. For instance, if the budget is

on an accrual basis, the entries made during the year into the ledger make up a double-entry system that generates both the budget outturn reports and financial statement disclosures.

Because public sector tax-financed entities do not exist for profit-oriented purposes, the profit and loss statement may be named as a statement of revenues earned and expenses incurred, in which the bottom line shows the money result indicating either a need of deficit financing or surplus usable to investments and/or to loan installments.

Governments (whether central, regional, or local) may also do consolidated accounts that merge accounts of controlled entities to the parent entity in a way that resembles how the business entities do consolidation in financial accounting. In these cases, government entities present also consolidated income statements, balance sheets, and cash flow statements.

The public financial and budgetary accounts create the micro-data for the national accounting system. This is the third major public accounting system, but this is not handled further in this article (Table 1):

## Accounting Principles and Concepts

The conceptual framework (CF) is a codification of chosen accounting principles that are illustrated in the ways of defining accounting concepts. The principles may be derived primarily from the observed current practice. In this pragmatic method, principles are derived less from an accounting theory. Accounting theory that is more than a rationalization of practice begins with establishing the environment and objectives of accounting, and then the logical structure of accounting definitions, assumptions, practices, and procedures are derived from these basic accounting objectives.

Although bookkeeping is an old institution dating back to ancient times, codification of accounting principles encompassing the conventions, rules, and procedures that are necessary to explain accepted accounting practice at a given time dates back to the nineteenth century. In the USA, the American Accounting Association issued its publication in 1936 entitled "A tentative statement of accounting principles underlying corporate financial statements" (McCullers and Schroeder 1982, p. 2). These principles have developed to *generally accepted accounting principles* (GAAP). This term refers to a consensus within the accounting profession that a given principle is generally accepted as being appropriate to the circumstances in which it is used (McCullers and Schroeder 1982, p. 26).

Although there are several possible sources for statements of accounting principles, the most authoritative are the national and international accounting standard boards. Nowadays, powerful standard setters like the Financial Accounting Standards Board (FASB) in the USA and International Accounting Standards Board (IASB) in the UK influence the world, and national standard setters align more and more with standards developed for international use.

Accounting principles can be divided in several ways; one way is to divide them to a three-

**Accounting Principles, Table 1** Accounting systems for different purposes in the public sector

| | Financial accounting (commercial accounting) | Budgetary accounting | System of national accounts – IMF's GFS |
|---|---|---|---|
| Purpose | General-purpose financial statements for decision-making and accountability | Budgetary follow-up and budget outturn calculations for accountability and decision-making | Public sector financial statistics forming a basis for macroeconomic analysis and policy formulation |
| Accounting approach | Accrual based[a] | Budget based[b] | Statistical principles – accrual basis |

[a]The use of accruals in commercial accounting may be more or less strong and be based on different theoretical accounting approaches
[b]Budgets may be cash based, modified cash based, modified accruals based, or accruals based

level structure composed of pervasive principles, broad operating principles, and detailed principles. Theoretically, principles of each level should interrelate with principles at the other two levels. However, many accounting practices have not been based on higher principles but have simply evolved from experience (McCullers and Schroeder 1982, p. 27). If accounting rules are principles based, the CF and its principles are able to guide separate standards of accounting so that they do not have to be very detailed (rules based). Standards may alternatively be rules based, meaning that standards are written in a very detailed manner to encompass widely all practical situations.

The **proprietary theory** of accounting emphasizes that financial accounting must be structured in a way that satisfies fore and most the owner's interests. All accounting principles and concepts are defined from the owner's interest. Owners' purpose is to increase their wealth, and revenue is the increase in proprietorship, and expense is the decrease in proprietorship. The most common international framework for financial statement presentation is the **conceptual framework of IASB**, which issues International Accounting Standards (IAS)/International Financial Reporting Standards (IFRS). The CF of IASB assumes that the financial accounting information that satisfies the needs of shareholders and creditors also satisfies the information needs of other users of financial statements, for instance, the government and its tax authorities, employees, vendors, customers, and the overall general public. During the last two decades, the CF has become more and more based on fair value measurement based on market values. This development has been driven especially from the point of view on how to assess market values of financial instruments, many of them being complicated and difficult to account for. The strong fair value measurement trend has aroused a lot of discussions about the complicated techniques to measure fair values when there are no active and liquid markets for some assets and liabilities. Especially in the public sector, the suitability of fair value measurement has been questionable.

Irrespective of the accounting context, whether private or public sector, we need some guidelines about the principles of good accounting practices. A general list of accounting principles of financial accounting is (Glautier and Underdown 1994, pp. 42–55) as follows:

1. Entity
2. Money measurement
3. Going concern
4. Cost
5. Realization
6. Accruals
7. Matching
8. Periodicity
9. Consistency
10. Prudence

The purpose of the **entity** concept is to make clear distinction between affairs of the accounting entity and other entities just like in the business accounting. The difficulty comes in defining what constitutes the government accounting entity and what off-budget entities should be consolidated to it. Several criteria can be used, for instance, government ownership and control of the entity, entity's dependence on government transfers, and the legal form of the entity. Furthermore, central, regional, and local governments consist of many sub-organizations, and there are a lot of variations of criteria, which determine which of these sub-organizations form also accounting sub-entities that do their own separate book closures even if they are not own legal entities.

The need of consolidation becomes more and more important when public sectors are decentralizing and outsourcing activities outside their core organizations, to off-budget entities, to state-owned companies, etc. The political decision-making body needs financial as well as nonfinancial information of the whole group of entities that have been assigned public functions and public money. Defining the demarcation lines between accounting entities and the extent to how far the consolidation should be done determines the sphere of annual financial reporting.

The convention is to make financial accounting in **money terms**. This is problematic in the public

sector financial accounting. There are assets like human resources that cannot be valued in monetary terms. Furthermore, it is difficult to value in money public sector activities that protect the environment or enhance social well-being. Hence, nonfinancial reporting is at least as important as the financial reporting. The more budgets have been formed as performance-based budgets, the more the accountable public sector organizations are responsible to disclose annual activity reports combining financial and nonfinancial information necessary to show the efficiency and cost-effectiveness of accountable entities in using public money.

The **going concern** principle is based on the assumption that the business is a continuing one at least in the near future, not on the verge of cessation and bankruptcy. Many assets in a firm derive their value from the employment in the profit creation process. Should the firm cease to operate the value which could be obtained for these assets on a closing-down sale would be much less probably than their book value.

The same reasoning of asset valuation doesn't fit well with the public sector's side where assets derive mainly their value from the service provision capacity, not from the capacity to earn money inflows. Furthermore, the central government and governments on other administrative levels have a good foundation for continuity because of tax financing and because of statutory functions that cannot abruptly be ceased in a bankruptcy-like situation. On the other hand, many kinds of accounting sub-entities inside the government can be ceased with administrative and political decisions, and in this case, going concern principle is not guaranteed forever. Only the totalities of sovereign states have the capacity in practice (with some historical exceptions, naturally) to live forever.

The cost measurement is based typically on **historical costs** rather than on **current costs** in public sector accounting. Historical cost is based on the reference to the cost of acquisition of assets. While the historical cost concept may raise many problems for the business accountant, it does less such problems for the public sector accountant. Historical costs of acquisition of assets do not take into consideration changes in the purchasing power of money. Specific assets face normally inflation and rising prices, which means, among other things, that depreciations calculated from historical asset values do not finance replacement investments and may twist the income statement from financing point of view.

Historical costs without revaluations are more reliable and less ambiguous than changing current money values of assets. However, this historical cost approach is not always followed consistently, because in some cases revaluations are possible also in the public accounting tradition, for instance, regarding real estates, if the reassessed value is considered reasonably permanent.

**Realization** principle refers to the moment the firm realizes an asset by selling or disposing it in some other ways. The realization price compared to the book value reflects the profit earned by this disposal. In the private sector accounting, realization principle has been criticized, and business sector accounting standards accept also holding gains and holding losses that are included to the profit accounts. However, in the public sector, holding gains and holding losses are less useful concepts, because assets are kept for service and goods provision for citizens, and it is more meaningful to account for only realized transactions that have money and budget effects.

**Periodicity** means that the life of an accounting entity must be divided to constant periods **for reporting purposes. Matching** is a fundamental accounting principle, which means that for computing profit, all costs are matched against the revenues to which they relate. This makes possible to match revenues and expenses for the accounting **period**. There are many practical difficulties in the way of achieving perfect matching. Depreciation is one of the most important means to allocate costs to accounting periods. It means allocating asset's costs to those accounting periods during the asset is used.

However, matching in public sector does not fit to non-exchange transactions forming the major part of governmental transactions. In these transactions (for instance, transfers to enterprises and

households or tax revenues), one cannot find a causal relationship between expenditures and revenues like in the private sector. When services are delivered free of charge to inhabitants, matching of expenditures and revenues is not possible. In the public sector, depreciation can be interpreted to mean **matching of expenditures with the use of factors of production** in the service and goods processing.

**Materiality** is also a pervasive concept that relates to the qualitative characteristics, especially relevance. Material (both quantitatively and qualitatively assessed) amounts are relevant because they make a difference to a decision-maker. A decision not to disclose certain information may be made, for instance, because investors have no need for that kind of information (it is not relevant) or because the amounts involved are too small to make a difference (they are not material) (McCullers and Schroeder 1982, p. 22). In the public sector, material thresholds, for instance, regarding frauds, may be interpreted to be very low because public entities use tax money taken from tax-paying citizens.

**Consistency** is important for making relevant comparisons between accounting periods. If there is no continuity of accounting methods and rules, the use of information becomes difficult. Comparability between accounting entities and consistency in accounting methods over time increase the value of accounting information. It is advantageous from this principle that accounting standards do not change continuously causing constant and costly training and changes in accounting technology.

**Prudence** in the public sector favors carefulness in estimating budget incomes so that they are not exaggerated and carefulness in estimating budget expenditures so that they are not underestimated. **Prudence** is also a general guiding principle for financial statements. Prudence means, among other things, that all costs must be recognized fully and that only realized profits are recognized in the income statement.

Standards should be **understandable**. In the public sector context, which especially in developing and poor countries have limited resources for accounting, clear and understandable standards rather than complicated and difficult-to-read standards are a necessity.

Also from this point of view, it is wise in the public sector not to push accruals too far into speculative territories. This implies prudence in valuing assets and revenues. It means also cautiousness in accounting for liabilities. For instance, post-employment benefits and social policy cash transfers are recognized based on the legal commitment for due payments. Assets are valued at the undepreciated portion of the acquisition cost. If revaluations are allowed, they have only an impact upon the balance sheet. The transactions-based approach leads to the fact that only realized gains and losses can have an impact on the income statement.

One example of this kind of prudence and historical cost valuation in government accounting is the Finnish central government's accounting rules. Both the principles of prudence and historical cost valuation are expressed in the Finnish Budget Decree Section 66 c and d (600/1997) regarding the valuation of noncurrent and current assets:

1. The final accounts shall include entries as follows:
2. Receivables at their face value, but not in excess of their probable value
3. Securities and other similar financial assets included in financial assets at their cost value or at their estimated market value at the end of the financial period, if lower than their cost value
4. Liabilities at face value adjusted by the positive or negative issue premium arising when a loan is taken out or if the debt is tied to an index or to another similar standard of comparison, at the higher value resulting from changes therein (1175/2002)

## Qualitative Characteristics of Accounting Information

The conceptual frameworks consisting of basic accounting principles describe the qualitative characteristics of accounting information. The

qualitative characteristics may be in a hierarchical order or without a hierarchy. The FASB used to make a hierarchy, in which user-specific qualities of decision usefulness and understandability are the starting points. The qualities that distinguish better or more useful information from inferior or less useful are primary decision-specific qualities of relevance and reliability. To be useful, information must be reliable as well as relevant to the information users. These two qualities have such ingredients as timeliness, verifiability, predictive value, neutrality, representational faithfulness, and feedback value. Secondary qualities are comparability and consistency and materiality as a threshold for recognition. One important quality attribute of financial statement information is that the costs of that information are not greater than its benefits. So, the pervasive constraint is that the benefits of accounting rules should be bigger than the costs of them (McCullers and Schroeder 1982, pp. 18–19).

The hierarchy from the point of view of public sector can be presented as follows. Because the decision usefulness for investors and shareowners is not relevant in the tax-financed public sector, the guiding criterion for usefulness is accountability information, that is, information for political decision-making bodies regarding the performance of accountable administration.

Quality criteria hierarchy:

1. Useful information especially for accountability purposes
2. Relevance, reliability, and sufficiency
3. Understandability and timeliness
4. Comparability and consistency of accounting methods
5. Cost constraints

In order that public entities' principals get the purposeful and efficient information they need, the information must be relevant, and also in sufficient amounts, and furthermore reliable. Of importance is also that the reporting must be understandable, not so complicated that only experts can take out the information contents. Non-understandable way of presenting information, even if it is relevant and reliable, makes the reporting pointless and not useful. This holds also regarding the timeliness criterion, because the decision-making bodies representing citizens must get the reporting information in a reasonable time after the budget and accounting period for surveillance purposes.

## Dynamic and Static Accounting Theories

Revenue-expenditure-led (income statement) approach is dynamic as it focuses as a starting point to the flows of transactions generating costs and revenues during the accounting period. Revenue-expense model and income statement approach is transaction based and uses historical costs rather than revaluations following fair values. The assets-liabilities-led (balance sheet) approach is more of a static approach, because it focuses on the measurement of the stocks of asset and liabilities.

The focus in financial statements varies between the value measurement of assets and liabilities in the balance sheet and the net income measurement in the income statement. The Anglo-American accounting approach favors nowadays the assets-liabilities-led (balance sheet) approach, while the Continental European approach has been dominated longer by the dynamic revenue-expense and income statement approach. International standards for listed companies, IAS/IFRS and FASB standards, comply with the asset-liability model and balance sheet approach. These standards rely heavily on concepts and measurements derived from fair value accounting.

This approach causes problems in the identification, measurement, and evaluation of assets and liabilities in the public sector. The problematic issues are connected to the characteristics of public goods, public monuments, heritage assets, infrastructure assets, and community assets, which seldom have any liquid markets and tractable market values and benefit the public at large and not the owner (the public entity). The revenue-expense theory and the income statement approach take into consideration public sector specialties and information needs better than the balance sheet and asset-liability approach.

Proprietary and entity theories provide different views of firms' balance sheets and the roles of owners and other financiers of invested assets. The proprietary theory of accounting has emphasized accounting for the owners and shareholders. Entity theory moves the accounting basis from the balance sheet, which is understood from the owners' perspective, toward a flow basis of accounting, in which transactions concerning revenues and costs form the essential core of the business cycles of production. For the accounting representation, the business cycle of the firm is more important than the valuation of the firm (Biondi 2012). This reasoning is also valid on the public sector accounting side with the important adjustment that tax-financed entities do not aim to earn revenues for profit-oriented purposes but for provision of needed services in a cost-efficient manner.

## Conclusions

The public sector accounting principles should be based on the specific circumstances prevailing in the public sector and on the primary users of public accounting information. These starting points mean that public sector accounting cannot be identical to business sector financial accounting. The different starting points cause different framework contents regarding accounting objectives, primary users, recognition and valuation of financial statement elements, disclosure modes, and activity reporting.

The international private sector standards like IAS/IFRS are based more on the Anglo-American assets-liabilities and balance sheet approach than on the expenditure-revenue theory and income statement approach that has a strong position in many European public sectors that use accruals. Many European countries use still also cash-based or modified cash-based accounting. If the European Union decides to base its possible future EPSAS on reasonable accruals, this means less drastic changes for countries, which already use moderate accruals. The changes are obviously greater in those EU member states whose accounting tradition is cash based or modified cash based (Oulasvirta 2014).

# Accrual Accounting

Adriana Tiron-Tudor
Department of Accounting and Audit, Babes-Bolyai University, Cluj-Napoca, Romania

## Synonyms

Accrual basis of accounting; Accrual concept; Accrual method; Accrual system

## Definition

Accrual accounting is "a basis of accounting according to which all the transactions and events are recorded when they occur, without a relation with cash inflow or outflow. Therefore, the operations and events are recorded in the accounting records and recognized in the set of financial statements of the periods to which they relate. The elements recognized under accrual accounting are assets, liabilities, net assets/equity, revenue, and expenses" (IPSASB 2006).

## The Accounting Methods

The importance of the accounting information presented in the financial statements for decision-makers is very well known in practice as well as in literature. The financial statements represent the result of recording transactions in a sequential and systematic manner following a set of rules, prescribed in the accounting method. Most entities typically use one of two basic accounting methods to record transactions: accrual or cash basis.

The term "accrual basis" refers to recording expenses or revenues when they occur, regardless of when cash is exchanged. Alternatively, the term "cash basis" refers to any entry recording with a cash impact. According to the accrual concept, expenses occur when materials are consumed, not when materials are acquired. Revenues are recorded when the right to receive the money is issued not when the money is received in cash or by bank transfer. Opposite to this, the cash method supposes a flow of money in and out of an entity, so revenues are recorded when money is received, and expenses, when it is paid.

Cash-basis statements are simple, readable, but they can result in misleading financial statements. Accrual basis is relative complex and more expensive to implement, but looks at the economic reality of the activities, rather than the actual cash inflows and outflows.

"Accruals" and "cash" are often portrayed as opposing end-points on a spectrum of possible bases for accounting and budgeting. In practice, other two hybrids approaches can be classified either modified cash or modified accrual basis. In the case of modified cash, cash receipts and disbursements made in a budget year are recorded and reported up to a specified period after year end. While in the case of modified accrual, the accrual basis is used with some exceptions like assets (e.g., fixed assets) or liabilities, not recognized.

A good measure of an entity's operating strength is the economic result of a period, and a clear public signal of this fundamental strength is the accounting result. But the accounting result differs from cash basis to an accrual basis of accounting, and for this reason, the accounting literature has extensively researched the precision or ability of an accounting system to capture the reality of economic transactions. The source of accuracy accounting arises from the following problem: period t cash flows are not period t economic earnings. For example, the manager may have spent cash on investments that will pay back in the future, so the cash outflow is not a purely economic loss. Alternatively, assets may have declined in value leading to economic loss, but there is no cash flow impact because the goods are not sold. Accounting, therefore, adjusts the operating cash flows (cash-basis accounting) to construct a measure of operating earnings. This adjustment is called accruals (accrual-basis accounting).

The need for this method arose out of the increasing complexity of an entity's operations and a desire for more accurate financial information. According to accrual accounting, the events should also be reflected in the financial statements during the same reporting period as that of transactions, given a more precise image of entity's current financial condition.

## Accrual Accounting Influence on Financial Statements

Accrual-based financial statements contain a more comprehensive set of information than that provided by cash-based statements. They inform the users about past transactions with cash

movements during the reporting period, the entity's resource, and future events like obligations to pay cash or consume other entity's resources at the reporting date. In comparison with another accounting basis, accrual basis provides information about past transactions and other events, very useful to decision-makers and for accountability purposes (IPSASB 2014).

Accrual-basis financial statements set include the following: financial position, financial performance, cash flow, changes in net assets/equity, budget execution, and notes. The main elements of accrual-basis financial statements are assets, liabilities, revenues, expenses, owners' contributions, and distributions.

- Assets represent resources controlled by an entity at present, the result of a past event.
- Liabilities are the current obligation of an entity for resources' outflow that results from a past event.
- Revenues are increases in the net financial position of the entity, other than arising from ownership contributions.
- Expenses are decreases in the net financial position of the entity, other than those resulting from the owners' contributions.
- Owners' contributions are inflows of owners' resources, which establish or increase interest in the net financial position of the entity.
- Owners' distributions are outflows of resources from the entity, distributed to owners, which return or reduce an interest in the net financial position of the entity.

Only by the use of the accrual basis of accounting, an entity respects the matching principle by reporting expense on its statement of financial performance in the same period as the related revenues. According to the accrual basis, economic events are recognized by matching revenues to expenses at the time in which the transaction occurs, either when a flow of money appears. By deduction, totals of expenditures and income are recognized in the financial statements, whether or not were flows of cash in that period.

There are three different influences of expenses on the balance sheet. If the expense payment is made at the time the expense was incurred, it will be a decrease in cash. If there will be a future payment of the expense, it will be an increase in accounts payable. And, if the expense was paid in advance, it will be a decrease in prepaid expenses.

The financial performance statement reflects revenues when they are earned – which often occurs before the cash is received from the customers. Similarly, as in the case of expenses, there are three different influences of the revenues in the balance sheet. If the service or sale were for cash, it would be an increase in cash. If the service were performed on credit, it would be increased in accounts receivable. If the customer had paid in advance for the service and the service was conducted afterward, it would be a decrease in unearned revenues.

At the end of the period under the accrual-basis accounting, the time differences in recognizing revenues and expenses result in the following adjusting entries:

(a) Accrued revenue/expenses are recognized before cash is received/paid, using receivables and liabilities accounts.
(b) Deferred revenues/expenditures are recognized after cash is received/paid, using receivables and liabilities accounts.

This method provides a more accurate picture of the entity's current financial performance and position. On the one side, all of the revenues earned during the period and the other side, all of the expenses incurred to obtain the revenues, according to the accrual basis, will be presented in the income statement. And all assets that were earned are reported, and all liabilities that were incurred will be reported. Cash-basis information is provided in the statement of cash flows that present inflow and outflow of cash grouped with operating, investing, and financing activities.

## Shifting from Cash to Accrual Accounting in the Public Sector

The cash-basis system was considered for a long time as being perfect for the public sector

accounting and budgeting, being also sustained by the supreme principle of compliance with rules and regulations. However, over the last 30 years, there has been a shift in the orientation of accounting and budgeting systems in the public sector from cash to accruals, because of numerous changes and an increased complexity of public sector activities across the world, categorized as New Public Management (NPM) characteristics.

The movement from cash to accrual accounting in public sector is significant because it is supposed to go from a strict situation of cashed incomes and paid expenses to a situation where the emphasis is on achievements in performance conditions.

According to the accrual-basis system, the emphasis is on efficiency.

During the last 30 years, the number of countries having moved or moving toward accrual accounting at different government levels (central, regional, local) has increased, but still nowadays, the world's governments are evenly split between cash-basis and accrual-basis systems.

Since the late 1980s, only Australia and New Zealand recorded a significant movement toward accruals-basis accounting in the public sector. The proponents were claiming that it provides new and, arguably, better information decision on the balance between current and capital expenditure, taking into account the opportunity cost of capital and its consumption over time. Then, the trend extended to other countries where there is a strong influence of the management philosophy, as the UK and the USA. The transition approach differs around the globe, from a total shift toward accrual accounting (the New Zeeland case, in 1992) to gradual changes in different regions (e.g., in the case of USA), or different level of governments and institutions. In the UK, accrual accounting was introduced for local authority accounts from the mid-nineteenth century and for the National Health services at the beginning of the 1990s. Then in 1993 accrual-basis accounting was proposed to be accepted by the central authority and was subsequently implemented (until 2001) (Hyndman and Connolly 2011).

Nowadays in Europe, accrual accounting is used more and more by national governments: 17 EU member states already use accrual accounting (PWC 2014), and several others are in the process of switching to it. The member states develop their country-specific rules for accrual accounting in the public sector basis according with the International Public Sector Accounting Standards (IPSAS). There are a lot of countries, defined by pluralism and diversity which apply accrual at different or all levels of government (Caperchione and Lapsley 2011; Busca et al. 2015; Manes-Rossi et al. 2016) or with the intention to use accrual or which have started the implementation process of accrual. But the move to the accrual basis for public sector financial reporting has not gained universal acceptance; a lot of countries are circumspect about accrual-basis accounting and budgeting in the public sector.

For example, in 2010, the German federal government abandoned its accrual-basis budgeting and accounting reform. The main reason for this action was the parliamentarian concerns about the loss of their control over the budget and the government's finances (Jones and Luder 2011).

The use of accrual basis for accounting is widespread in many countries, but the status is not the same as the budget. Most states, even if they apply accrual basis for accounting, prefer to apply cash basis for budgeting or use accruals to only a limited number of transactions in the budget (Anessi-Pessina et al. 2016). The accrual budget is not so popular because is believed to risk budget discipline and affect the control of public money and there is a legislature's general resistance to its adoption, due to the complexity of accruals (Blöndal 2003).

## Pro and Cons of Accrual Accounting in Public Sector Entities

In this context, there have been many pro and con debates of accrual accounting in the public sector and over the benefits and risks of using accrual basis in public sector accounting. But the expected benefits are overwhelmingly more

significant in comparison to the drawbacks, and, thus, an increasing number of governments initiate the adoption of accrual accounting (Guthrie 1998).

Accrual accounting is considered a component of managerialism and New Public Management (NPM). The most cited arguments for accrual accounting refers to providing a transparent, clear, and pertinent imagine regarding financial/nonfinancial performance of public institutions (Guthrie 1998), increasing the external accountability (Ryan 1998) and the capacity to reasonably reflect the patrimony (Kober et al. 2010).

Another group of arguments relates to the capacity to obtain full cost information, a critical element for improved organizational planning, controlling, and accountability (Chan 2003), budgeting and allocation of financial resources, outsourcing decisions, service costs evaluation, and internal accountability (Likierman 2000).

The accrual accounting benefits, according to FEE (2016), IFAC (2013), and Khan and Meyers (2009), are as follows:

- Using assets effectively, because accrual accounting requires complete recording of all assets that are relevant to the overall stance of fiscal policy and financial sustainability.
- Managing liabilities, because under accrual accounting, both financial and nonfinancial liabilities have to be reported in the annual accounts such as accounts payable for the receipt of goods and services and employee liabilities like for civil service pensions and provide a broader measure of the burden of government financial commitments.
- Managing performance, by having a more complete and realistic picture of costs for a particular reporting period and the total cost of a government's activities, essential for assessing the efficiency of public services.
- Addressing the citizens' right to know whether public services represent value for money.
- Increasing the comparability between the financial position and performance of the EU member states.
- Giving a complete picture of governments' revenue and expenses, allowing them to initiate action at an early enough stage, thereby preserving assets for future generations.
- Contributing to long-term planning and assist governments in sustainable decision-making.

On an opposite position, some researchers consider evident that the expected benefits of accrual accounting cannot be achieved (Cohen et al. 2013) or implementing accrual basis in this sector in not useful or necessary (Nasi and Steccolini 2008). The top of the disadvantages of accrual accounting basis list includes some of the follow items. To record some financial events, more transactions are required. At the end of the period, there are more complex requirements to calculate and manage the adjustments. The accrual accounting implementation often requires professional accounting training. Professional judgment is used to identify the timing and scope of revenues and expense. The preparation of the financial reports takes longer since income/expense adjustments require additional investigation.

Also, there are some suspicions considering that the accrual adjustments are relevant, but their reliability can be imperfect. Specifically, reliability or precision can be impaired because management can make estimation mistakes or can misuse its discretion over accruals to conceal economic reality, or the possibility to recognize and assets correctly.

The acceptance of accrual accounting in the public sector has not been unanimous. Some researchers express serious doubts about the applicability of accrual accounting in the public sector. They invoke the fact that the accrual techniques have been specifically designed to serve the needs of private firms. Other issues are the measurement problems, lack of theoretical support and increased subjectivity (Chan 2003), and the diverse nature of accountability in the public sector. Guthrie (1998) considers that accrual accounting does not measure outcomes, and accrual accounting provides a small idea of performance, focusing on the cost of services and efficiency. An important topic is also related to the difficulty and costs of implementation. All of these should be considered reasons why a

developed country refused to adopt IPSAS standards, basis to accrual accounting.

## Supporters of Accrual in Public Sector

There are a lot of important supporters of accrual basis in public sector accounting like IFAC, who issued IPSAS based on accrual accounting, WB, OECD, and IMF at an international level and FEE and EU Commission on the European scale.

IFAC and IPSASB have commented extensively on the advantages of accrual accounting for governments with different occasions and in various reports and studies. IMF, also a supporter of accrual accounting, considers the recent evolution of accrual accounting implementation in public sector in different states as an explicit recognition of the limits of cash accounting. A significant contribution to the spread of accrual accounting in the public sector is due to the development of accrual-based international standards for accounting (IPSAS) and government fiscal and financial reporting (GFSM). Moreover, the professionalization of the government accounting staff, the implementation of private sector techniques into the public sector, and the advent of computerized financial management information systems (FMISs) which significantly reduce the transaction costs of collecting and consolidating accrual-based information are strong arguments (IMF 2016).

At a European level, the European Commission/Eurostat (2013) underlines the fact that "Accruals accounting is the only accepted basis that provides an accurate image of the financial and economic position and performance of a government [. . .]". In line with this, FEE supports the move from cash to accrual accounting by issuing statements in connection with accrual accounting and organizing workshops and conference on this theme. FEE aims at highlighting some of the main advantages of adopting accrual accounting and its contribution to governments' financial decision-making process. Accrual accounting supports macro fiscal policy and a better management of assets and liabilities by measuring assets and liabilities relevant to the overall stance of fiscal policy and fiscal sustainability, but which are not measured by cash accounting (e.g., accounts payable, employee pension liability, PPP).

At the same time, the countries which decide to pass from cash accounting to accrual accounting are warned by IFAC to analyze very carefully the validity and the benefits expected from this reform taking into account the conditions, the priorities, and the local characteristics. Also, the European Federation of Accountants issued a paper outlining the risks involved and explaining the essential preconditions for the successful implementation of accrual accounting.

## Conclusions

\Even if the accrual accounting system is for some authors accurate and suitable for the private sector, it gained over the last 30 years more adepts in the public sector. There are a lot of arguments for this, leading to the idea that accrual accounting would provide more appropriate information for decision-makers and lead to better decision-making.

If accrual accounting adoption in public sector accounting will reach its goals, it is too early to express an opinion. However, a complete analysis will be possible in the future, after some years of application.

Despite the limited empirical evidence of its usefulness in the public sector and the reservations expressed by academics, the adoption of accrual accounting is regarded nowadays, as self-evident (Deaconu et al. 2011).

# Accrual Budget

Caridad Martí
University of Zaragoza, Zaragoza, Spain

## Definition

Accrual budgeting consists of the use of accrual accounting measures in the budgeting process and it entails planning on an accrual basis, that is, budgetary spending authorizations and income forecasts are formulated in accrual terms. Under the accrual basis, the effects of transactions and other economic events are recognized when the underlying economic events occur, regardless of the timing of related cash flows. Following this basis, revenues are recognized when income is earned, and expenses are recognized when liabilities are incurred or resources are consumed. Accrual budgets incorporate in addition to cash flows, all projected noncash transactions and stocks of assets and liabilities.

## Introduction

According to the accounting basis used to prepare the budget in public administrations, budgets can be classified into three main kinds: cash and commitments budget, obligation-based budget, and accrual budget. A cash budget shows receipts and expenditures, meaning the cash inflows and cash outflows at the actual collection or payment days. Under a cash-based system, budgets would not include stocks of assets or liabilities. Obligation-based budgeting recognizes legal obligations or commitments entered into a period when a public entity incurs a legal liability, regardless of when cash is paid or collected and regardless of when resources are earned or consumed (United States Government Accountability Office, GAO 2000). It implies the recording of an obligation and setting aside the funds for the actual cash outflow that will take place.

Accrual budgets seek to show the estimated full resource, rather than just the cash implications

of the planned government activities. For example, accrual budgets include, as budgeted expenses, noncash items such as depreciation and civil service pension liabilities. This enables accrual budgets to provide information to the parliament and other stakeholders of not just the cash costs but of the full resource implications of the planned government activities. An accrual budget can be presented in the same financial statements as those presented at the end of the year: a budgeted operating statement, a budgeted balance sheet, a budgeted statement of changes in taxpayer' funds, and a budgeted statement of cash flows and notes to the budgeted financial statements. A budgeted operating statement shows budgeted expenses and revenues, meaning resources consumed or resources generated, irrespective of the collection or payment dates. A capital budget statement can also be presented in order to impose limits on capital expenditure and to limit debt (Robinson 2009).

The countries which have implemented accrual budgets have also changed their budget structures to focus on a performance orientation, with an explicit definition of outputs or services, and outcomes or impacts of public services and programs on citizens and society (Martí 2013). Input information has not been totally replaced because it provides necessary information for parliamentary control over public spending. Under accrual budgets, revenues and funding appropriations that include full accrual-based costs are linked to specifications of planned and actual performance in terms of results, outputs, and/or outcomes.

## Different Approaches of Accrual Budgeting

There are different approaches in the application of the accrual basis, which represent different levels of sophistication in public accounting systems. Accrual budgets can be fully implemented at all levels of government, at selected agencies/departments or at some programs. Besides, between the two extremes – accrual and cash – numerous variations can be put into practice, depending on the assets, liabilities, and costs that are recognized. The four main accounting bases are the full accrual basis, the modified accrual basis, the modified cash basis, and the full cash basis (International Federation of Accountants, IFAC 1993).

For some governmental program areas, such as government employees' salaries, there are not important differences between accrual and cash figures because the lapse of time between the occurrence of a transaction that commits the government to make a payment or generates a resource for government and the cash flow associated is relatively short. For other program areas, the differences can be significant. One of the fundamental differences between cash and accrual bases is the capitalization and depreciation of assets. Governmental entities hold a variety of capital assets, including office buildings, infrastructure, heritage, military equipment, and natural resources. The accounting of these elements as an asset is usually justified on the grounds of transparency, accountability, and effectiveness of public programs. A lot of the indebtedness of public administrations is related to the purchase of infrastructure and other fixed assets. The accounting of these assets in the balance sheets of governments may create incentives for more efficient asset management. If the purpose is to make the budgetary treatment of these assets consistent with their financial reporting treatment, following the accrual basis, it means that the total amount of the investment could be recognized in the capital budget and the depreciations in the operating budget. When they are assets already owned before the implementation of accrual accounting, it may be more complex and costly to account for and value them. The application of the accrual basis in accounting for investments implies the recording of depreciation in public operating budgets, which is a necessary component of public service costs.

A characteristic of accrual budgets is the possibility to include capital charges as a cost measure for the capital assets used by governmental departments, as in New Zealand. Capital charges were also applied in the United Kingdom and in Australia for several years, but they were withdrawn. The objective of capital charges is to

ensure that the prices of goods and services produced by government departments includes full production costs, including the government's cost of capital. In some situations, capital charges function as an incentive to encourage ministries and or departments to make proper use of investments and/or to dispose of unnecessary assets. Cash appropriated to government departments and agencies can include full accrual amounts including expenses that do not involve cash outflows, such as depreciation and capital charges. Alternatively, under a different version of accrual budgeting which is more easily implemented because it implies less changes, cash can be appropriated to departments only for the components of accrual expenses that involve payments.

Apart from short-term liabilities, governments owe long-term obligations such as bonds payable and employee pensions payable. Accrual budgeting moves budget recognition forward for the costs of some programs, such as loans and insurances, which involve future cash flows (Martí 2006). An advantage of budgeting for the accruing costs is the recognition of the government's costs at the time decisions are being made. This earlier recognition of costs improves the information available to policymakers about the costs associated with current decisions and may improve the incentives to manage these costs. However, this benefit is dependent on reasonable, unbiased estimates of the government's costs. The application of the accrual basis also allows the provision of indicators of long-term sustainability of public entities such as net equity and self-financing of investments. These measures require that the budget includes all economic transactions carried out by the different public administrations. Tax revenue is an specific public sector element, so there is not reference from the private sector about how to accounting for it. It is sometimes difficult to know when the economic transaction that results in tax revenue takes place. The full accrual treatment of tax revenue requires an accounting adjustment for doubtful tax receivables.

Accrual budgeting offers different possibilities showing that within each system, there is also some degree of heterogeneity. Different accounting bases for different elements of budget systems may also have a significant impact on the measurement of the public deficit and debt.

## International Overview of Accrual Budgeting Implementation

Countries such as New Zealand and Australia pioneered the introduction of accruals into governmental accounting systems in the 1990s, motivated by the limitations of traditional cash-based systems for tracking the efficiency of spending. By 1991, the appropriations, accounting, and budgeting of all government departments were on a full accrual basis in New Zealand (Pallot 2001). Various governments in Australia had implemented accrual output budgeting reforms in the 1990s (Carlin and Guthrie 2003). Accrual output-based budgeting are financing systems under which government agencies receive funding for the results -usually outputs- which they deliver. In 2001/2002, the United Kingdom implemented accrual budgeting, under the title of Resource Accounting and Budgeting, together with a framework for analyzing expenditure by departmental objectives, relating these to outputs (Likierman 2003).

Accrual budgeting and accounting systems have already been implemented in several European Union (EU) Member States (e.g., local governments in Germany, federal government in Austria). Many states and local governments in Switzerland apply accrual budgeting and accounting since the mid-1980s (Bergmann 2012). It was assumed that accounting and budgeting should be on the same basis and within a comprehensive system. In the Swedish local authorities, accrual budgeting and accounting were also introduced in the mid-1980s. Sweden weighed up the implementation of accrual budgeting in central government but decided not to implement it because it considered that cash budgeting enables better control over resources, particularly over capital investment. In 2010, the German federal government abandoned its accrual budgeting and accounting reform because parliamentarians feared that the change from an input to an output

orientation in the budget, together with the reduction of the number of individual appropriations, would result in a loss of their control over the budget and the government's finances (Jones and Lüder 2011). The United States applies cash and obligations-based budgeting because it considers that accrual budgeting raises challenges for the management and oversight of capital assets and expenses such as depreciation, and it does not include costs associated with future government operations, related to Social Security, Medicare, and Medicaid (GAO 2007).

In less developed countries, the role played by international organizations, reformers, and donors has been a catalyst for implementing Public Financial Management reforms, such as accrual budgeting, as in Botswana and Philippines. Developing countries face some barriers such as resource, capacity and technology constraints, corruption, and the existence of more urgent priorities. Instead of accrual budgeting, many developing countries have medium-term expenditure frameworks (MTEFs), consisting of setting out projections for both revenues and expenditures over a 3–5 year time horizon. MTEFs aim at guaranteeing the consistency of resource allocation with macroeconomic objectives and increasing the transparency of government operations over a medium-term policy agenda (Martí and Kasperskaya 2015).

## Debates About the Impact of Accrual Budgets

There are both advocates and detractors of the impact of accrual budgeting. The major limitation of the cash basis is that while this system accounts for short-term cash flows, receipts and payments, it ignores financial flows that do not involve the movement of cash, such as depreciation, write-off of assets, and accrued interest. The latter elements are important if the full costs of governmental services have to be analyzed. The accounting for depreciation in budgeting follows the intergenerational equity principle, as it implies spreading the costs of capital assets in accordance with the distribution over time of the benefits that they generate. This could contribute to fairness between generations, that is, each generation should finance the cost of the services that it consumes.

If the budget is prepared on an accrual basis, it ensures symmetry with the accrual-based financial statements prepared at the end of the year. The application of dual systems – accrual accounting and cash or modified cash budgeting– requires extensive reconciliations between the two systems and may hinder the acceptance of the accrual-based accounting system. However, the application of the same accounting basis to the budget and to the financial statements allows the comparison of both figures, contributing to accountability.

The implementation of an accrual budget is justified on the grounds of harmonization with the two other macro accounting systems prepared by governments: the National Accounts and the Government Finance Statistics, which are both prepared on an accrual basis. National Accounts are a macro-economic accounting system that is compiled on the basis of a globally harmonized accounting standard. Government Finance Statistics are a macroeconomic statistical system for government finances published by the International Monetary Fund and designed to support fiscal analysis. There is a convergence project between these two systems and the International Public Sector Accounting Standards (IPSAS) of the IFAC in order to reduce differences to the maximum extent possible. In Europe, the National Accounts are based on the European System of National and Regional Accounts (ESA) published by Eurostat. EU member states are obliged to prepare National Accounts based on ESA to meet the convergence criteria of the EU Treaty regarding budgetary discipline. When translating from government accounting (microeconomic perspective) to National Accounts, the cash-accrual adjustments are more diverse and material in relation to the deficit/surplus in countries still having cash-based budgetary reporting (Jesus and Jorge 2015). A number of countries – Australia,

New Zealand, and the United Kingdom – aligned the accounting standards across budgets, statistics, and accounts on the accrual basis in order to promote greater transparency and accountability at the national level.

The rate of countries applying accrual budgeting remains lower than that of accrual accounting and there appears to be less consensus regarding the merits of the adoption of accrual budgeting. This reluctance to adopt accrual budgeting can be attributed to its increased complexity, as perceived by politicians that meet to discuss budget appropriations in parliament (Blondal 2004). Parliamentarians may fear that the change from an input to an output orientation together with having to vote on accounting items such as depreciations may result in a loss of control over the budget and the government's finances. The introduction of accrual budgeting may also involve significant human, financial, and material resources, such as adequate information systems, and it requires the use of legislation to provide formal authority to the changes as well as political and/or managerial commitment, and the driving force of central budgetary units to coordinate the reform.

Many countries that have adopted accrual budgeting did it as part of a context of public sector reforms that were labeled New Public Management reforms, which were intended to introduce "a more business-like public sector." Accrual budgeting is not usually considered an objective in itself but an accounting reform needed to change from bureaucratic controls to management-oriented public administrations. These reforms may include devolution of responsibility for financial and resource management, outsourcing, managing for results, etc. Some countries (for instance, some sectors in Australia and New Zealand) have also implemented purchaser-provider systems that aim to introduce quasi-market arrangements for governmental agencies by making them competitive suppliers of public sector outputs. In purchaser-provider systems, service-delivery agencies receive funding on the basis of the outputs they deliver to the public with specified quantity, quality, and price in performance targets. If government wants to present performance measures of the efficiency or cost-effectiveness of the services provided, the costs of the outputs must be based on accrual measures even if an accrual-based budget system is not implemented. Decisions that require a comparison of prices with other public- or private-sector providers are usually based on full accrual budgeting measures including costs such as depreciations, because the accrual basis is the underlying assumption for preparing financial information in business entities.

The choice of different accounting bases used to prepare the budget depends on the purposes and functions assigned to the budget. Different management systems may require different budgeting systems, since there is not a one-size-fits-all approach for all countries.

## Conclusion

A cash-based budget focuses on the traditional control of legality, trying to assure conformity with the expenditure authorizations, and provides information to evaluate the short-term economic impact of fiscal policy on borrowing needs and cash flow situation. By contrast, an accrual budget can be used to inform decision making about future borrowing needs, the cost of government operations, long-term consequences of current government programs, and it provides incentives for an efficient asset management.

Accrual and cash must not be seen as alternative bases but as complementary systems. In general, financial control of government operations needs to focus on both expenditures and expenses in order to have a complete financial view on the use of government resources. As investors in the private sector need a complete set of financial statements – including an income statement, a balance sheet, a statement of cash flows, a statement of changes in equity, and notes to the financial statements – to understand a business' financial situation and performance, both accrual and cash measures are important for understanding governments' financial situation.

## Introduction

Internationalization has become an unavoidable task and important strategy to cope with challenges of globalization to higher education. With the student population in higher education becoming increasingly internationalized and diversified, the acculturation and adaptation challenges and problems of these non-local students in local culture, society, and institutions have become a critical issue which needs attention of policy makers and senior administrators of higher education institutions. How to form better policies and administrative procedures to facilitate non-local students' better acculturation and sociocultural, psychological, and academic adaptation has become a vital task of senior management of higher education institutions.

In recent years, the rapid globalization has challenged all aspects of human life and society. Higher education is without exception. Globalization has profound impact on higher education. One aspect of the influence is the rapid student mobility and the increasing internationalization of student body in higher education institutions. The influx of international students in local higher

education institutions would bring about benefits since intercultural communication, exchange, and mutual understanding are valuable for social renewing and recreation (Maddux et al. 2010). However, these non-local students are facing challenges in the process of acculturation into local society and culture. Their sociocultural, psychological, and academic adaptation to local universities have gained increasing research attention for shaping better university policies and administrative strategies (e.g., Akhtar et al. 2015; Bodycott 2012). Against this background, this article firstly discusses the acculturation issues of international students in local universities under challenges of globalization. Then the article presents a study on mainland Chinese students' adaptation in universities in Hong Kong to illustrate different adaptation challenges faced by mainland Chinese students. Finally, the article discusses the implications of the study to university policies and administration.

Acculturation is a very important and necessary process for international students in higher education institutions in host countries. It is defined as "the process of cultural and psychological change that follows the meeting between different cultures" (Ozer 2015, p. 717). Adaptation is an important concept in acculturation research. In acculturation framework, adaptation refers to "the level of 'fit' between the acculturating individual and the mainstream cultural environment" (Berry and Sam 1997; Yu 2013, p. 729). Berry (1985) proposed that international students would experience four types of adaptation in a foreign culture, namely, environmental adaptation, sociocultural adaptation, psychological adaptation, and academic adaptation. The environmental adaptation refers to the adaptation to the weather, food, and living condition of the foreign culture. The sociocultural adaptation refers to "the acquisition of skills that are appropriate in the host culture and the general competence of mastering everyday life in the new cultural context" (Ozer 2015, p. 718). It may include the ability to deal with different social norms and interpersonal relationships (Zeng and Watkins 2010) and the ability to "fit in or negotiate interactive aspects of the host culture" (Yu 2013, p. 729). The psychological adaptation is related to "the affective aspect of acculturating to a new cultural environment" and includes evaluation of the condition of one's psychological well-being such as levels of psychological stress (Ozer 2015, p. 718). The academic adaptation is related to how international students adapt to the language of the host culture and the teaching styles of the host country (Zeng and Watkins 2010). A large body of literature suggests that international students would experience significant difficulties, challenges, and stresses when adapting to the host social, cultural, and educational environments. For example, they may experience difficulties in adapting to social and cultural norms, language problems, difficulties in adapting to educational system, changes in social support and interpersonal relationship, and even racial discrimination (Lee et al. 2004; Sherry et al. 2010; Smith and Khawaja 2011). Students studying in a foreign culture may also encounter significant psychological problems such as anxiety and depression (Lee et al. 2004; O'Reilly et al. 2010). In addition, there might be related physical symptoms or health problems. Furthermore, some studies showed that Asian international students tended to not seek help from consultation or therapist because they perceived this conduct will lose their faces (Lee et al. 2004). Besides the difficulties and problems in sociocultural and psychological adaptation, research also showed that international students would experience higher stress in academic adaptation (Mudhovozi 2011; Yu and Wright 2017). Particularly, some research studies suggest that mainland Chinese international students would experience significant academic stress in studying in English-speaking countries such as the USA due to low levels of English language proficiency, dysfunctional interaction with local faculty, great cultural and educational gap, and their higher achievement motivation (Yan and Berliner 2009).

International students' adaptations might be influenced by a set of diversified factors. For example, research found that psychological adaptation was related to factors such as personality, copying style, and social support (Bektas et al.

2009; Lee et al. 2004; Zhang et al. 2010), while sociocultural adjustment is related to stay length in host culture, knowledge about host culture, proficiency in foreign language, social network and social support, and contact with people in host culture (Forbush and Foucault-Welles 2016; Ozer 2015; Ward and Kennedy 1999). Research also suggests that international students' sociocultural adaptation in host culture is influenced by their preconception and perception of the host culture (Constantine et al. 2005). With regard to the academic adaptation, research found that it was significantly influenced by international students' proficiency in local language, extracurricular activity engagement, interaction with teachers, peer relationship, commitment to institution, and goals for graduation and employment (Dunn 2006; Yu 2013; Yu and Wright 2016). Better adaptations in different aspects could result in a lot of positive outcomes of international students such as higher life satisfaction (Hoti et al. 2017), college and university satisfaction (Mahmood 2014), lower dropout rates (Tinto 1993), college persistence intention (Ojeda et al. 2014), increased intellectual and psychological health, and higher academic achievement (Pascarella and Terenzini 2005; Shafaei and Razak 2016; Yorke and Longden 2007). Therefore, to foster international students' sociocultural, psychological, and academic adaptation is an important task of universities in the context of globalization.

International students' adaptation in different aspects plays a vital role in policy making and administration of higher education institutions. Particularly, in the context of globalization, internationalization of higher education is a significant goal of higher education institutions in many countries and regions. One important indicator in the internationalization of higher education institution is the internationalization of student population. In addition, international students could bring a lot of benefits to higher education institutions and host countries. Many countries made clear policies for recruiting increasing numbers of international students for economic reasons for which the enrollment of these students could bring a significant amount of revenues to higher education institutions in host countries (Andrade 2006). Another benefit is sociocultural which is imperative under challenge of globalization. Challenged by the advancement of globalization, intercultural competence and communication have become vital for all the nations and for students in higher education institutions. The recruitment of international students could help to contribute to the intercultural communication and competence of higher education institutions and nations (Andrade 2006). Therefore, higher education institutions must have in-depth understanding of the adaptation problems, status, and process of international students and develop related policies and administrative procedures to facilitate international students' academic, sociocultural, and psychological adaptation in host culture and host institution. Although many existing studies investigated the international students' adaptation in higher education institutions in host countries, they mainly focused on one or two types of adaptation. In addition, few studies focused on aspect of university policy and administration. Furthermore, most of the existing studies were conducted in Western context. Few of them put focus on Asian context such as Hong Kong. In recent years, there have been an increasing number of mainland Chinese students studying in higher education institutions in Hong Kong. Previously being a British colony, Hong Kong has returned to China as a Special Administrative Region (HKSAR) since 1997. However, Hong Kong is significantly different from mainland China in many aspects such as law and educational system (Li 2015). Hong Kong has long been an attractive place for mainland Chinese students due to its mitigation of both Chinese and Western cultures, mature law system, good infrastructure, and international higher education which uses English as medium of instruction (Zeng and Watkins 2010). According to the statistics of the University Grants Committee (UGC), in the 2017/2018 academic year, the proportion of mainland Chinese students occupied 12% of the total student population in the eight public universities in Hong Kong funded by UGC, while the number of other non-local students only occupied 5%. Although the mainland Chinese students occupied the largest proportion of

international student population, few research studies investigated their intercultural (socioeconomic and psychological) and academic adaptation in higher education institutions in Hong Kong.

Mainland Chinese students' adaptation in Hong Kong universities is worth to investigate not only because of their large proportion in body of international students but also because of the special relationship between mainland culture and culture of Hong Kong, which is called as a sibling culture that was rarely studied (Zeng and Watkins 2010). In addition, many existing study focused on the research on sociocultural and psychological adaptation but neglected the academic adaptation which was argued by Yu (2013) and other scholars (Tinto 1993; Zeng 2006) as an important aspect in cross-cultural adaptation.

## Objectives and Purpose of the Present Study

The aim of the present study was to investigate the sociocultural, psychological, and academic adjustment of mainland Chinese students who studied in local universities in Hong Kong and to give implications to university policy making and administrative adjustment. It tried to address the following research questions:

1. How were sociocultural, psychological, and academic adaptations of mainland Chinese students in Hong Kong universities?
2. What factors contributed to their adaptation?
3. What are the implications of the adaptation conditions of mainland Chinese students to university policy making and administrative adjustment?

## Methods

### Participants and Procedure

The participants of the present study were 54 mainland Chinese students studying in different programs in 4 higher education institutions in Hong Kong, including The University of Hong Kong, The Chinese University of Hong Kong, The Hong Kong University of Science and Technology, and The Education University of Hong Kong. To get more balanced and representative views, the participants covered students from different programs, study years, hometown, as well as study mode (undergraduate and postgraduate).

The present study is one part of the large research project investigating non-local students' adaptation in Hong Kong higher education institutions. Eight universities founded by the University Grants Committee were contacted by the researcher, and finally six of them agreed to participate in the project. The project included both survey and focus group interview. All the students participated in the survey were invited to join a focus group interview. Finally, 54 students from 4 universities joined the focus group interview. Each focus group lasted for around 1 h and was audio-recorded. For each focus group, a trained researcher was present as moderator. A focus group protocol developed by the research team of the project was adopted to guide the focus group. The protocol included a list of questions to ask students' perceptions about their sociocultural, psychological, and academic adaptation in their institutions, as well as their perceived support from universities.

### Data Analyses

Each audio record of the focus group was transcribed into texts by trained student helpers. Then a senior researcher with qualitative research background carefully read the texts for several rounds to identify the coding structure and major themes. During several rounds of coding, the major themes were identified, refined, and finalized.

## Sociocultural Adaptation of Mainland Chinese Students

In general, mainland Chinese students demonstrated a generally higher level of sociocultural adaptation in their own institutions but lower level of sociocultural adaptation in the broad Hong Kong society. Therefore, they demonstrated higher sense of belonging to their own institutions but lower sense of belonging to the broad Hong

Kong society. Several factors influenced mainland students' sociocultural adaptation, including language barrier, cultural and value difference, political tension, and lack of social support.

### Language Barrier

First, language barrier is a major factor influencing mainland Chinese students' sociocultural adaptation. Many mainland Chinese students, particularly for the freshman-year students and the students from North China, mentioned that language was one of biggest challenges for them in Hong Kong. One student mentioned that although she has stayed for almost 4 years in Hong Kong, she still felt that Cantonese was a big challenge for her and she still could not speak fluent Cantonese. The language difficulty also influenced these students' establishment of social network and friendship making with local students.

### Cultural Difference and Challenge in Friendship Making with Local Students

Apart from language barrier, cultural and value differences also accounted for the lower level of sociocultural adaptation of mainland Chinese students. In addition, compared with their friendship making with other mainland Chinese students, mainland Chinese students had less friendship making and lower social interaction with local students. No matter in closeness of friendship or in quantity of friendship, local friends are not comparable to mainland friends. Again, language barrier was one biggest hindering factor for mainland Chinese students to establish friendship with local students particularly in early years of their university study. In addition, cultural difference and stereotype was another major hindering factor to mainland Chinese students' interaction and friendship making with local students. For example, mainland Chinese students said that local students would perceive mainland students as "over academic-oriented" and less engage in other activities. Also, local students may perceive mainland students as "too obedient" and lack of free and critical thinking.

Some mainland Chinese students mentioned that they did not want to collaborate with or work with local students particularly in doing group projects in their academic study because they thought many local students did not take serious attitude toward their academic study compared with mainland Chinese students, most of whom were hardworking. Furthermore, mainland Chinese students used the words "different funny bone" to describe the cultural difference between them and local students. They expressed that they cannot get and understand the "funny bone" of jokes that made by local students even if they could understand Cantonese. This deeper cultural difference hindered the deeper friendship making between mainland and local students. Moreover, mainland Chinese students' interaction and friendship making with local students was influenced by their willingness and attitude toward interaction with local students. A few mainland Chinese students took a "go with the flow" attitude toward interacting and making friendship with local students. Only few mainland students held a more active and proactive attitude toward interaction with local students.

### Influence of Political Tension and Discrimination Between Hong Kong and China in Recent Years

The third factor influencing sociocultural adaptation of mainland Chinese students in Hong Kong universities and broad society was political tension between mainland China and Hong Kong in recent years after Hong Kong's return as a Special Administrative Region of China. In recent years, there have been a series of events related to political and system tensions that sharpened the conflicts between Hong Kong and mainland China. These events included "Occupy Central Event," "parallel traders," mainland women giving birth to children in Hong Kong, etc. For some mainland Chinese students, these political-related events did not have much impact on their life, academic study, and friendship making with local students in their own higher education institutions. They also did not experience much discrimination by local students in their own institutions. One major reason, expressed by some mainland students, might be that many local students can have rationale thinking who will not attribute mainland Chinese students to the group of "parallel traders."

However, mainland Chinese students generally expressed that they experienced different levels of discrimination in the broad Hong Kong society and outside of their campuses. For example, some mainland Chinese students mentioned that the uncivil deeds and behaviors of mainland Chinese parallel traders and some mainland travelers have caused the discrimination and prototypical perception of Hong Kong local people to normal mainland Chinese people. This aroused in mainland Chinese students' hearts the "shame" feelings because they felt that they were also from mainland China. However, some mainland students perceived that not all the Hong Kong local people but only those with lower socioeconomic status tended to have discriminant attitude. For those local people with higher socioeconomic status, they tended to have a more collaborative attitude toward mainland China people. Besides, some mainland Chinese students expressed an understanding and support of the political freedom of Hong Kong local people and thought this situation was understandable due to the historical reasons.

### Appreciation of Some Sociocultural Aspects of Hong Kong

Although mainland Chinese students encountered challenges and difficulties in their sociocultural adaptation to the broad Hong Kong society, many of them claimed that they appreciated the "freedom" in Hong Kong's social system and culture. For example, when talking about and comparing higher education system in mainland China and Hong Kong, some mainland Chinese students expressed that the "class" structure in higher education institutions in mainland China sometimes "restricted" or "forced" them being together, while they can enjoy more freedom in Hong Kong higher education institutions to do what they want to do and join activities based on their own interests but not outside forces.

## Psychological Adaptation of Mainland Chinese Students

Some mainland Chinese students encountered significant challenges in psychological adaptation particularly in their early year of study in higher education institutions in Hong Kong. They mainly felt a sense of loneliness. There were three factors contributing to their difficulties in psychological adaptation. The first factor was language problem. The second factor was the sudden loss of family and social support. The third factor was their difficulty in adapting to the higher educational system in Hong Kong. As mentioned by some mainland Chinese students, the universities in mainland China will have "class" as a unit for connecting all students from the same major. In addition, universities in mainland China will also arrange students from the same major to live together. In such a way, students will develop more sense of belonging and gain more support from other fellow students. However, the universities in Hong Kong did not have the class system and dormitory arrangement; therefore, mainland China students felt that they were very isolated and cannot gain enough social support, which therefore led to their feeling of loneliness.

However, there were also some mainland Chinese students expressing that they did not encounter much problems in psychological adaptation. In other words, they had smooth or very good psychological adaptation. One influencing factor was students' personality and attitudes. The students having good psychological adaptation normally had positive attitudes and proactive personality.

## Academic Adaptation of Mainland Chinese Students

For freshman-year mainland Chinese students, the large amount of English reading in their subjects was one of the biggest challenges in their academic adaptation. Some mainland Chinese students also mentioned that English writing was also a big challenge in their academic adaptation. However, this challenge would gradually become weaker along with the progression of their academic study. Some mainland Chinese students expressed that they did not like to do group presentation which was a major assessment format in Hong Kong universities.

Fourth, the different educational structure in Hong Kong contributed to their less of friends from both groups. As mentioned by Student 8, there were no concept and structure of "class" in universities in Hong Kong which was different from universities in mainland China in which students from the same major will be assigned to a class. The class will help to strengthen the bonds and connection among students. Therefore, mainland students felt isolated and lost in Hong Kong. They thought this educational structure made them to have less opportunities to meet and establish friendship (academic).

## Mainland Chinese Students' Sense of Belonging to Their Institutions and Perceived University Support to Their Adaptation

One interesting point was that although mainland Chinese students had lower sociocultural adaptation in the broad Hong Kong society, they generally had a high sense of belonging to their own institutions. One major reason was that these students perceived that their universities provided good support to non-local students. For example, mainland Chinese students from one university mentioned that their institution developed a scheme which will offer peer support to non-local students. Each newly enrolled mainland Chinese students will be assigned a "buddy" who will be a graduate from the institution to give support, help, and consultation to the student regarding to the study, life, and psychology of the student. Several mainland Chinese students perceived this scheme very useful to their adaptation to the academic study in their institution.

Another useful university support, mentioned by some mainland Chinese students, was the O-Camp specially organized for mainland Chinese students in some universities. Some mainland Chinese students mentioned that this scheme helped them to know and establish network with other mainland Chinese students to gain social and academic support and advice from them. Particularly, many freshman-year mainland Chinese students mentioned that support from senior mainland Chinese students was vital for their quick adaptation when their Cantonese language proficiency was very low at the very beginning. Some mainland Chinese students thought that the O-Camp specifically for mainland Chinese students was much more useful than the O-Camp for all the students in their departments in which local students occupied the major student population and mainland Chinese students felt the difficulty to join different teamwork activities due to language barriers and cannot enjoy the meaning of those activities. In addition, some mainland Chinese students also expressed difficulty to join some traditional O-Camp in their universities because these activities were very "energy-consuming" and "burdensome."

In addition, some mainland Chinese students perceived that some extracurricular activities related to introduction of culture and language of Hong Kong were useful for enriching their understanding of Hong Kong and enhancing their Cantonese language proficiency. These kinds of activities also offer opportunities for mainland Chinese students to establish network and friendship with local students.

However, mainland Chinese students also perceived that most of the students' societies in their universities were targeting at recruiting local students, and they felt the difficulty to join these societies. These students mentioned that there were few societies with an international nature to incorporate or attract more non-local students. This might hinder the intercultural communication between local and mainland Chinese students.

## Implications to University Policy and Administration

As mentioned earlier, to facilitate non-local students' better adaptation (including sociocultural, psychological, and academic adaptation) is an urgent and vital task for different higher education institutions under the challenge of globalization. Based on the findings of the present study, it could be identified that several major factors influencing adaptation of non-local students might be

language barriers, cultural and value difference, political conflict or tensions, and different educational system. To facilitate non-local students' better adaptation, university policy making needs to consider how to make more suitable policies targeting on these different areas. For example, policy makers and administrators should think how to offer more effective language learning courses for non-local students, to facilitate mutual cultural understanding between local and non-local students, and to give necessary support to help non-local students understand more the educational system and learning style of the host country. Meanwhile, how to make different mechanisms and activities in campus more internationalized such as organizing and establishing more internationalized student societies and make O-Camp more internationalized might also help non-local students to gain better sociocultural, psychological, and academic adaptation.

# Accumulation of Local Government Savings

Min Su
Louisiana State University,
Baton Rouge, LA, USA

## Synonyms

Financial slack; Unreserved general fund balance

## Definition

Government saving, often referred to as financial slack, is the financial resources that are accounting based and can be measured objectively. It is measured as a government's unreserved or unassigned general fund balance.

## Introduction

Government savings can be a conundrum that perplexes many taxpayers. Excessive savings indicate that taxpayers either pay unnecessarily high taxes or they do not receive adequate returns on services. Insufficient savings on the other hand leave government officials little financial flexibility to respond to unanticipated events. The Great Recession and its aftermath have renewed interest in understanding government savings. The advent of the Great Recession in 2008 brought tremendous challenge to local administrators. They had to tackle with increased demand for public goods and services with diminished revenue. Struggling local governments could expect little help, if any, from their state governments because state governments faced the same fiscal challenge.

The Great Recession is not the only economic downturn that challenged government fiscal administration. According to the National Bureau of Economic Research (NBER), the United States has experienced ten major economic recessions since the 1950s. Over time, government administrators and researchers have realized the importance of accumulating savings (i.e., financial slack) to alleviate the negative impacts of economic recessions. This entry provides an overview of the concept of financial slack in governmental budgeting and financial management research. The entry summarizes theories and perspectives used to understand why governments accumulate financial slack. The entry also presents a brief overview of the size of financial slack in municipal governments in the United States.

## Defining Financial Slack

Slack is a concept that appears in various disciplines. Organizational theorists define it as the excess resources available to an organization, including excess liquidity, redundant employees, unused capacities, discretionary capital expenditures, and public services provided in excess of those required (Cyert and March 1963). In the public administration and public budgeting

literature, researchers are interested in financial slack, referring to slack resources that are accounting based and can be measured objectively. Financial slack reflects a government's liquid financial resources. Governments keep financial slack either in formally established reserve funds with *dedicated* purposes or in the unreserved general fund balances as *discretionary* savings.

## Two Types of Government Savings

### Dedicated Savings: Rainy Day Funds

The most common dedicated savings are those formally established fiscal reserves for expenditure stabilization, popularly known as the rainy day funds. The rainy day funds have various names. For instance, California names its rainy day fund the "Special Fund for Economic Uncertainties." Georgia calls its rainy day fund the "Revenue Shortfall Fund." Massachusetts names its fund the "Commonwealth Stabilization Fund." As of today, all 50 states have some sort of rainy day funds or other reserve funds dedicated for expenditure stabilization. At the local level, however, establishing designated rainy day funds or budget stabilization funds is not a common practice. Local governments do not see rainy day funds as a must-have financial management strategy.

The dedicated savings usually have legally defined withdrawal rules in statutes or constitutions. Fourteen states impose additional supermajority voting requirements to withdraw these savings (PEW Charitable Trust 2017). Regarding the accumulation of dedicated savings, governments often cap the size of rainy day funds, usually 5–10% of annual expenditure. Once the rainy day funds reach the maximum savings target, they will stop allocating money to these funds. Thus, there is not much variation in the size of rainy day funds.

### Discretionary Savings: Unreserved General Fund Balance

Different from state governments that keep savings in formally established reserve funds, most local governments keep their savings in the general fund balance. The general fund is a government's primary operating fund. The general fund balance is the difference between a general fund's current assets and current liabilities at the end of a fiscal year. Part of the general fund balances are reserved and not available for appropriation due to their non-spendable nature or externally imposed and enforceable limitations. The rest of the fund balance that carries no restrictions on future use are unreserved general fund balances. Because the unreserved general fund balance has no dedicated purpose and its usage is under the managerial discretion of government administrators, it is governments' discretionary savings.

The accumulation of these discretionary savings – the unreserved general fund balance – is not subject to any legal rules nor is there any cap on the maximum size of fund balance. State governments and professional organizations provide guidelines on the adequate minimum unreserved general fund balance level. For instance, the Government Finance Officers Association (GFOA) recommends that local governments should maintain unreserved general fund balance of approximately 2 months (or 15%) of annual operating expenditure. Large governments can have a lower level of no less than 5%. Research finds that local governments often keep unreserved general fund balance much more than the recommended minimum level. Thus, there is sizable variation of unreserved general fund balances among local governments.

## Fund Balance Reporting: GASB 34 and GASB 54

### GASB 34

The Governmental Accounting Standards Board (GASB), established in 1984, issues accounting and financial standards for US state and local governments to improve the quality of financial reporting and the usefulness of government financial information. In 1999, GASB published Statement 34 that brought the most significant changes to government financial reporting. Statement 34 requires fund balances should be reported in two categories: reserved and unreserved. When fund balance is *reserved*, the resources are either in non-spendable form (such as inventory) or

legally restricted to a particular purpose (such as federal grants for building schools). The proportion of fund balance that is not reserved is called the *unreserved* fund balance. The unreserved fund balance in the general fund can be used for any purpose at all. Government sometimes designates unreserved fund balance to express its intention to use available resources in a particular manner. However, since designations are not legally binding, these designations are still part of the unreserved fund balance.

### GASB 54

When implementing the GASB 34, some jurisdictions were unclear about the distinctions between reserved and unreserved fund balances. For instance, some jurisdictions treat designated fund balances as binding restrictions. Some were not clear about the relationship between reserved fund balances and restricted net assets. To provide clearer fund balance classifications, GASB issued Statement 54 in 2009. Statement 54 establishes a five-category fund balance hierarchy, which includes non-spendable, restricted, committed, assigned, and unassigned fund balances. This hierarchical classification is based on the constraints a government faces when using resources reported in governmental funds.

The *non-spendable* fund balance includes resources that cannot be spent because they are either not in spendable form or legally required to be maintained intact. The *restricted* fund balance includes resources that can be spent only for the specific purposes stipulated by constitution, external resource providers, or through enabling legislation. The *committed* fund balance includes resources that can be used for the specific purposes determined by a formal action of the government's highest level of decision-making authority. The *assigned* fund balance includes amounts that can be used by the government for specific purposes but do not meet the criteria to be classified as restricted or committed. The *unassigned* fund balance is the residual amounts that not included in other classifications. State governments implemented Statement 54 for fiscal years ending June 30, 2011. Local governments followed thereafter.

## Theoretical Debates over Organizational Saving

Researchers have controversial views on why governments accumulate slack. Public choice scholars following the pioneering work of Niskanen (1971) portray governments as budget-maximizing bureaucracies. These scholars assume rational bureaucrats always seek to increase budgets, as the size of budgets is linked to their own prestige, power, salaries, and other personal benefits. This budget-maximizing incentive leads to the oversupply of public goods, public sector expansion, and inefficiency. Niskanen later proposed an alternative model assuming that bureaucrats maximize slack through accumulating the difference between revenues and the minimum costs of production. They use the accumulated slack to maximize personal utility.

Niskanen's work has generated a large array of studies on bureaucracy and bureaucratic decision-making that either test his hypotheses or question the assumptions and implications of his model. One assumption often under attack, for multiple reasons, is the assumption that bureaucrats are rational, single-minded, and self-interest-driven budget or slack maximizers. First, behavioral economists recognize human beings have bounded rationality due to the cognitive limits of the human mind and the complexity of the real world (Simon 1979). Individuals with bounded rationality do not always aim at maximizing personal utility but prefer satisficing, calling into question the assumption. Second, the slack maximization model ignores the fact that decision-makers often face multiple managerial objectives within their organizations and have various motivations that go hand in hand with the concern of personal gains maximization. Third, the slack maximization model fails to explain the sizable variations of slack accumulation among comparable governments and that some governments are running on empty. Apparently, simply portraying governments as slack-maximizing leviathans is not a satisfactory explanation of why government accumulates financial slack.

Cyert and March's (1963) analysis of firms' behavior offers a different explanation of

organizations' slack accumulation than public choice economists. Under the assumptions of bounded rationality, multiple and often conflicting goals, and the existence of uncertainty, Cyert and March believe firms do not aim at optimizing. Instead, they generate disparity – called organizational slack – between the resources available to the organization and the necessary payments required to maintain the organization's coalition. Slack protects organizational systems from unanticipated and unpleasant disruptions in a turbulent environment (Cyert and March 1963; O'Toole and Meier 2010). Slack serves as a cushion protecting organizations from internal managerial goal conflicts and external environmental uncertainties. Slack increases managers and administrators' managerial discretion so that they are able to deviate from the single-minded loss aversion to pursue efficiency, innovation, and greater performance even in times of resource scarcity (Simsek et al. 2007). In summary, organizational theorists consider slack accumulation a precautionary management strategy for organizational survival and success. They believe that organizations facing more risk factors are in greater need of slack. Managers in such organizations have greater motivation to accumulate slack.

## Factors that Explain Local Governments' Financial Slack Accumulation

In the public budgeting and financial management literature, researchers usually use the unreserved general fund balance to measure financial slack. They do not consider rainy day funds and other reserve funds as financial slack because these funds have legally binding dedicated purposes and cannot be used at managers' discretion. Researchers find financial slack has many managerial benefits to governments. For instance, unreserved general fund balance stabilizes government expenditures in economic downturn years (Marlowe 2005). In addition to expenditure stabilization, unreserved general fund balance smooths governments' cash flow, thereby reducing governments' short-term borrowing (Su and Hildreth 2018). Unreserved general fund balance also helps governments maintain investment-grade bond ratings (Marlowe 2011). These managerial benefits may motive local governments to increase savings.

On the other hand, organization theory's risk-saving hypothesis indicates governments facing more risk factors are in greater need of savings. Administrators in these governments have greater motivation to accumulate savings. Su (2018) used a dynamic model to analyze over 2000 municipal governments in the United States before and after the Great Recession. Results show that risk factors such as revenue volatility and non-discretionary categories lead to greater municipal discretionary savings. High-risk factor has a larger impact on municipal savings than the low-risk factor. Stewart et al. (2013) examined the relationship between economic volatility and governmental savings based on county-level data in Illinois, North Carolina, and Mississippi. They found that greater volatility in property tax and other revenues leads to higher savings. Findings in these two studies both support organization theory's risk-saving hypothesis. Risk factors inherent in a government's fiscal structure lead to greater government savings. The characteristics of a government also matter. Cities with larger population, more politically conservative, reformed, and professional, accumulate more savings (Hendrick 2006). Wealthier cities demonstrate greater ability of accumulating unreserved general fund balance.

## An Overview of Municipal Governments' Discretionary Savings

This section of the entry provides a brief overview of municipal discretionary savings measured by unreserved general fund balances of 2,160 American cities from fiscal years 2003 to 2011. Data comes from GFOA's Financial Indicators database. Figure 1 illustrates the trend of municipal savings over time. The trend demonstrates a clear pro-cyclical pattern: during

**Accumulation of Local Government Savings, Fig. 1** Trend of discretionary savings by American cities

**Accumulation of Local Government Savings, Fig. 2** Municipal discretionary savings by city size

economic expansion, cities increased discretionary savings, and the unreserved general fund balances as a percent of operating expenditure peaked when the US economy reached its summit in 2007. Discretionary savings drained away quickly during the Great Recession. When the economy recovered from recession, discretionary savings slowly recovered. On average during the 9 years, cities in the sample maintained unreserved general fund balances about 21% of operating expenditure (or equal to 2.5 months of operating expenditure). This national average is close to but slightly above the GFOA's recommended benchmark of unreserved general fund balances about 15% (or 2 months) of operating expenditure.

Figure 2 demonstrates that small cities (those in the first quartile) accumulated savings twice as

The Eight Major Economic Regions defined by the U.S. Bureau of Economic Analysis

**Accumulation of Local Government Savings, Fig. 3** Municipal discretionary savings by economic regions

much as large cities (those in the fourth quartile) did. This finding is consistent with the results in Hendrick's (2006) study based on a sample of cities in the Chicago metropolitan area. Figure 3 demonstrates a regional pattern of municipal savings. On average, cities in the New England and the Mideast regions saved far less than cities in the rest of the United States. Cities in the Southwest region accumulated more savings, almost three times as much as those in the New England region did.

## Conclusion

This entry introduces the concept of financial slack in governmental budgeting and financial management research. The entry summarizes theories and perspectives used to understand why governments accumulate financial slack. The entry also presents the size of financial slack in municipal governments in the United States. Now that many municipal governments have recovered from the worst economic

downturn and started rebuilding their reserves, understanding what determines municipal discretionary savings and the adequate levels of discretionary savings becomes critical for both policymakers and taxpayers. For municipal officials, maintaining an adequate level of discretionary savings protects their governments from potential risks and uncertainties. The adequate level of savings is determined by managerial benefits, the risk factors a government faces, and certain characteristics. For state policymakers, they should give local government officials enough discretion in designing their savings policies. There is no "one size fits all" optimal savings level for all municipal governments. For taxpayers, this entry suggests accumulating savings does not indicate their municipal governments are slack maximizers. Governments do so partially to build up a cushion against risks and uncertainties.

# Active Representation

Joan M. Gibran
College of Public Service, Tennessee State University, Nashville, TN, USA

## Synonyms

Advocacy, representativeness, acting on behalf of some individuals, groups, or societies

## Definition

Administrative action that purposefully pursues the interests of persons with whom administrators share common bonds.

## Introduction

The theory of representative bureaucracy holds that an organization, which mirrors the demographic characteristics of the population it serves will be more responsive to the interests of the public from which it is drawn. This is based on the idea that in a democracy, public administrators should not only mirror the society from which they are drawn, they should also hold values in

common with that society. Such a bureaucracy would be more responsive to the people government represents. Following this logic leads to assumption that the presence of minorities in public agencies ensures greater responsiveness to minority concerns.

There is an important distinction between passive and active representation. Passive or "sociological representation" refers to administrators' source or origin and the degree to which they reflect the demographic composition of the population at large. Active representation is the *purposeful* pursuit of the interests administrators share with those they represent (Mosher 1982). Pitkin distinguished between active and passive representation by pointing out that the passive representative is one who is "standing for" those he or she, represents, not as an active force but in a symbolic capacity. On the other hand, the active representative is one who is "acting for" others in ways that correspond to what they embody and represent as a group (Pitkin 1967). Thus, the concept of representative bureaucracy connects administrators and their actions to those with whom they share common bonds through the concept of active representation.

Early scholars assumed that merely passively representing the population would lead to active representation. But the link between passive and active representation is not a direct one, and many factors mediate between these two forms of representation. It was not until researchers identified administrative behavior as an intervening variable that they cleared the way for an extensive body of research, which positively identified the attitudes and values of public administrators and their representation of community interests as mediating factors in the relationship between passive and active representation. Administrative behavior emerged from this research as a significant nexus between the two forms of representation.

These developments allowed researchers to make the important distinction between holding similar attitudes with represented populations and actually behaving in ways consistent with what the represented population would expect on issues of common concern. With this distinction clarified, researchers turned their attention to the task of identifying the factors shaping administrators' attitudes and influencing their behavior. As a result of this work, it is now an accepted wisdom that public administrators' demographic characteristics, their acceptance of a representative role, and their perceptions, personal values and professional values, organizational environment, and administrative discretion are all significant variables in the mediation process between passive and active representation.

The following sections will review the settled knowledge on the significant variables linking passive and active representation.

## Demographic and Social Influences

The earliest studies on the subject of representative bureaucracy sought to establish measures of representativeness and verify the existence of passive representation. Mosher was the first to identify variables intervening between passive and active representation. He identified the social background and socialization of individuals as important factors in motivating active representation. Other researchers later explored active representation by looking at the relationship between sex, race, ethnicity, personal values, attitudes, and active representation. Their research confirmed that these variables are significant in explaining active representation. Since then, research has also confirmed that even after individuals become associated with an organization, their racial background continues to influence their attitudes and behavior.

On the assumption that bureaucrats maximize their own values when making decisions, the theory of representative bureaucracy posits that personal values influence administrators to make decisions which seek to maximize the policy preferences of the population groups with which they identify because, in so doing, they are serving their own interests. Their personal values, held in common with their demographic counterparts, move administrators to seek greater access to policy processes and promote policy outcomes, which they believe are more responsive to the interests of their community. Therefore, a central

assumption of the theory of representative bureaucracy is that minority administrators assume representative roles and become advocates for their group's interests because they tend to be socialized in the same values as their population counterparts and perceive group needs similarly.

Different demographic backgrounds produce common socialization experiences within groups. These experiences help to shape common attitudes, values, and beliefs (Brudney et al. 2000). Individual perception and behavior is shaped by social learning experiences, and even organizational behavior is a partial product of administrators' perceptions. So, administrators' perceptions and behavior are tied to personal experiences in the world around them and to their recollections of social experiences. The social background and values which inform perceptions, attitudes, and behaviors persist to motivate active representation even after the individual becomes a public administrator. Therefore, organizational socialization does not always overcome the effects of individual and group socialization that individuals bring to an organization and does not completely counteract representative tendencies in administrators.

Research on the effects of demographic factors, such as race, ethnicity, sex, and gender, on active representation helped to clarify why the demographic status of public administrators is significant for active representation by showing that though the organization influences administrative behavior, it does not generally overwhelm the effects of sex, social and demographic background, socialization, or ideology on individual inclinations to active representation. The general consensus is that demographics and individual values affect organizational action and makes these variables critical for understanding active representation because they interact with the organizational environment to encourage or discourage active representation.

Further research showed that race and ideology are highly significant variables in explaining administrative behavior and active representation. They also demonstrated that political attitudes mediate the personal relationship between sex and gender and that administrative behavior, attitudes, and experiences are divergent between sexes. Gender encompasses social differences in the experiences of men and women with respect to the same processes, practices, images, and ideologies. These differences in attitudes and orientations help to shape the priorities administrators attach to different policy alternatives making these variables important for translating passive representation into active representation (Keiser et al. 2002; Saidel and Loscocco 2005).

## Organizational Influences

In addition to earlier studies focusing on individual and group characteristics, a second generation of research developed around the task of identifying the factors within the organization and its environment that translate passive representation into active representation. This research demonstrated that it is necessary, but not sufficient, that administrators come from a particular background and possess certain demographic characteristics to be motivated to pursue active representation. There are other variables than personal or social values and demographic characteristics important in explaining the transition process from passive to active representation of minority group interests. Some of these other variables include the organizational environment, the issue area under consideration, the degree to which employees are organized into groups, and the functional position and physical location of minority administrators within the agency.

We now have strong evidence that within the organizational context, a convergence between professional norms, gender issues, and personal values exerts strong influence over administrative choices, particularly in gendered policy areas (Saidel and Loscocco). Moreover, the inclusion of the issue of concern on the agency's policy agenda makes administrators more willing to pursue active representation. Hence, when citizen groups and institutions both promote and press for particular policy outcomes, the organization's external environment becomes a source of heightened stimulus for active representation with agency personnel. This influence is found to be even more significant when the consequences of

policies have clear implications for the groups they affect. Research has also confirmed that in addition to internal and external environmental factors, the relevance of a particular policy issue to the group in question is highly significant in motivating active representation.

Active representation is encouraged when an issue matters to a minority community. Having the issue on the organization's policy agenda makes active representation more likely (Meier and England). But administrator's willingness to engage in active representation is not uniformly likely at all organizational levels. Research indicates that the organizational level at which the administrators work is significant for their willingness to pursue active representation. For example, street-level administrators are sometimes more actively representative than higher-level administrators. Differences in administrators' willingness to engage in active representation depending on the organizational level were further explained by research finding that organizational socialization is more likely to overwhelm the effects of community socialization at higher agency levels and that minority administrators at higher organizational levels with longer tenure are less likely to engage in active representation. But as the number of minority administrators at higher organizational levels approaches a critical mass, this negative effect can be overcome (Meier 1993). Additional research also indicates that individual social values counteract the effects of organizational socialization in gender-sensitive policy areas in female administrators at higher organizational levels.

The connection between passive and active representation is stronger when administrators enjoy a higher level of discretion. This is more noticeable in administrators with longer organizational tenure (Seldon et al. 1998). This link between passive and active representation is reinforced when minority administrators are able to influence the direction of organizational policies and when they are involved in implementing these policies (Meier and England 1984). Active representation is also more likely when peer groups and associations formed within the organization reinforce and encourage active representation. These groups and associations provide administrators with a degree of immunity to organizational pressures, which could otherwise discourage active representation. Indeed, the physical proximity of minority individuals in organizations can reinforce group perspectives on pertinent policy issues. Isolated minorities in government organizations may feel more constrained by the organizational environment and be less likely to pursue active representation. But, if there is a sufficient number of a minority group within an organization who hold similar views to those held by the external community, it is more likely that they will assume a representative stance (Meier et al. 1999; Hindera and Young 1998). Therefore, greater diversity in public organizations augers well for active representation.

Organizational characteristics and the type of government agency in which administrators work are also significant variables for understanding active representation. Administrators working in agencies that reward and encourage advocacy are more likely to engage in active representation and when the external community supports a particular policy response to a salient and directly relevant policy issue, passive representation is significantly linked to active representation (Meier 1993). So, employees who perceive strong external support on an issue and also believe that their agency has a mission of service tend to be less constrained by traditional notions of administrative neutrality and are more willing to actively pursue active representation of needy constituents.

In addition to the agency mission, agency policy function has also been found to be a significant factor for active representation to take place. Administrators working in redistributive agencies tend to be more likely to believe that their agencies support active representation (Thompson 1976; Seldon et al. 1998). This is partly explained by the fact that redistributive agencies are apt to hire more females and that their missions tend to highlight feminine rather than masculine skills and values. Employees of redistributive agencies are more likely to be socialized into advocacy and representative administrative roles. On the other hand, regulatory agencies tend to hire more men

and typically have missions based on more masculine values, and their employees are socialized to adopt more neutral administrative roles. In addition to the service category of the agency, several other factors are identified as meaningful for encouraging active representation. These include the public visibility of the agency, the level of citizenship participation, and the organization structure of the agency.

## Role Perceptions and Active Representation

A role is an enactment of behaviors which an individual believes others expect of him or her. Administrators adopt different conceptions of their roles depending on the ideals that appeal to them and their perceptions of what their close coworkers expect of them. These role perceptions play an important role in motivating active representation, because when administrators believe that others within and outside of their organization expect them to assume a representative role, they are more likely to act on those role perceptions. With respect to internal organizational expectations, when there is a visible presence of minorities in an agency, it increases the probability of active representation because it raises expectations that these minority administrators will be sympathetic to minority concerns and respond to address their needs. Research found that individual minority administrators may feel significant pressure to conform to minority group norms and assume representative roles on behalf of their community counterpart. Additionally, the external environment, political superiors, agency clientele, interest groups, and the general public also exert role pressures on public administrators. However, if they lack the status, the power, or the resources to act on these perceptions, administrators otherwise inclined toward active representation might actually refrain from such behavior despite their perception that there are internal and external expectations of active representation.

In many instances, the professional norms and standards of conduct of public administrators support the reception of advocacy roles, particularly in human service agencies. In redistributive agencies with advocacy functions, there is greater convergence between policy area, the agency type, and administrators' professional background. These convergences are powerful predictors of active representation. Street-level administrators in human service distributive agencies work at the front lines of their clients' problems. Their working environment is charged with high expectations from different sources. Therefore, these public administrators may be more attuned and responsive to pressures from both internal and external sources such as the legislature, agency leaders and peers, and agency recipients.

## Discretion and Active Representation

In order to have active representation, administrators must also be able to actually exercise their discretion to address group interests. In other words, they must have some degree of actual influence to implement policies in ways that back up values held in common with their clientele. They must not only be willing, but also able, to exercise discretion in areas where they assume a representative or advocacy role. Public administrators enjoy some degree of discretionary authority when their job responsibilities permit them to exercise their own judgment in making choices among alternative courses of action. Administrators with discretion can take actions that serve the interests of those they represent. Therefore, bureaucratic discretion and autonomy are yet another set of crucial conditions for active representation to take place.

Legislative mandates cannot provide sufficient details to govern decision-making for every aspect of policy implementation in all the myriad circumstances administrators face. Neither can they tailor every aspect of policy to fit every individual and circumstance. Thus, discretion becomes both necessary and unavoidable for administrators to interpret and apply the general legal requirements set out in laws and policy regulations to specific circumstances, persons, and

local situations. In view of this, many have argued that much of administrative discretion originates in legislative vagueness and is essentially legislative decision-making by proxy.

Political officials must then rely on public administrators for critical information. Because administrative agencies have more exposure in a policy area, they are more intimately aware of the big picture as well as its more intricate subparts. So, rather than being responsible only for the implementation of policy, public administrators are unavoidable partners with legislators in public policy making. By drawing on the expertise and knowledge of public administrators, legislators can frame better policy goals and better define programs and implementation parameters, which support objectives than they can by working on their own.

This makes administrators indispensable partners with legislators, who delegate some policy making details to public organizations and public administrators. This constitutes a grant of administrative discretion.

Legislative vagueness is another source of administrative discretion. Legislatures often deliberately leave legislation vague because clarity may be undesirable and impractical in a political system driven by pluralism and the need to build consensus. So, while administrators have some discretion in policy formulation and implementation, they are accountable to executive and legislative superiors and are constrained to taking the actions they believe best embody policy intent while responding to the needs of their communities. By interpreting and operationalizing policy, they are exercising discretion and assuming the responsibility of filling in the details of the broader policy legislation. While senior agency officials are responsible for shaping broad goals and directions for their agency, they are also removed from the service front lines of agency action. So, like their legislative superiors, agency leaders are not always able to provide sufficiently granular guidance to address all the specific and varied circumstances the agency workers encounter in day-to-day policy implementation. Hence, agency leaders are forced to rely on the bureaucratic intermediaries who interface most directly with agency clientele.

The most immediate consequence of this dependence is that agency leaders are forced to delegate day-to-day decision-making to lower-level administrators including street-level bureaucrats. When these conditions for active representation converge at the street level, administrators are more likely to act as active representatives than are individuals at higher organizational levels. This is because individuals at higher organizational levels interact less with agency clientele, while street-level employees engage with them on a one-on-one basis and are closer to their immediate needs. This proximity tends to motivate more active representation.

## Conclusion

The literature has identified variables such as administrators' demographic characteristics, their organizational role sets, personal value orientations, and agency type as significant variables motivating administrators to active representation on behalf of minorities in the communities they serve. These variables are well accepted as mediating between passive and active representation, and they include, but are not limited to, administrators' demographic characteristics, social background, personal values and ideology, role perceptions, internal and external role expectations, the organizational environment, the organizational level occupied by administrators, organizational diversity, agency type and function, and administration discretion.

The subject of active representation continues to attract considerable interest, and the research continues to refine our understanding of the mechanisms that link passive and active representation. But we still do not have a clear picture of how passive representation is actually translated into active representation because we have not completely identified how, or from where, administrators who assume a representative role derive the perception that they can exercise discretion and implement policies in a manner which benefits minority interests. We are yet to fully explore the effects and sources of administrative discretion as a catalyst that transforms passive

representation into active representation. We also do not fully understand all the factors that motivate administrators to go beyond the mere perception of discretion to take affirmative actions on behalf of those they represent. While we have established that there are differences in administrative behavior between organizational levels, we do not fully understand how the organizational context at different organizational levels interacts with individual and agency characteristics and perceptions of discretion to transform passive representatives into active representatives of community interests. Recently researchers have turned greater attention to uncovering how these personal and environmental factors affect administrator's perceptions and motivate active representation. These subjects are the new frontiers for research in active representation and representative bureaucracy.

A better understanding of these relationships will help to clarify the extent to which professional orientations and different modes of personal service ethics influence behaviors within the organizational context. Greater understanding of these variables understanding will do much to advance our understanding of the linkages between passive and active representation.

# Active Representation in Indigenous Public Managers: New Challenges to Representative Bureaucracy Theory

Verónica Figueroa Huencho and Juan Pablo Araya Orellana
Institute of Public Affairs-INAP, University of Chile, Santiago, Chile

## Synonyms

Ethnic managers self-identification; Indigenous institutionally; Indigenous managers performance

## Definition

It is the activation of specific performances developing by Indigenous public managers who act influenced by individual, organizational, or contextual factors, to contribute to improving the quality of the public implementations processes, looking to satisfy principally the interest of indigenous citizens.

## Section

Comparative and Development Public Administration and Policy.

## Introduction

Since the middle of the last century, a debate has arisen in Europe and the United States in public

administration literature about diversity in public bureaucracies and their influence in the processes of democratization. This debate put in tension concepts such as merit, hierarchy, or civil services career, typical of the Weberian Bureaucracy Model implemented in Latin America. However, today the need for a bureaucracy that represents great social diversity is evident.

The Theory of Representative Bureaucracy (TRB) holds that public agencies must reflect their societies to represent and serve the needs of those citizens considered "diverse" (ethnic, sexual, gender, or racial minorities), thus ensuring pluralism and legitimacy in public policies, improving their outcomes. In Latin America, since 1990, constitutional and legal reforms began to promote a better representation of these peoples (Figueroa Huencho 2014), but the limited outcomes of indigenous public policies show the necessity to give more attention to those factors that promote an active behavior of indigenous managers. Therefore, it is interesting to identify the factors that could trigger the change from a "passive" bureaucratic representation toward an "active" representation, where bureaucrats make decisions on behalf of those they represent.

In that sense, it is necessary to promote an agenda that contributes to the theoretical and empirical debate about TRB from the Latin American case, looking for similarities and differences with the Anglo-Saxon experience. Thus, it contributes to enriching the TRB considering some elements that characterize the public administration model in Latin America and that exert influence on active representation. For this, it is necessary to advance in the following aspects: (a) what the TRB means and the relevance of the context; (b) what are the challenges that arise in TRB to indigenous public managers; (c) what are the implications of a research agenda in this area.

## TRB: Relevant Factors for Active Representation

In the Latin American case, many states implemented Weberian models of organization and management. But societies have changed, and most developing countries in this region face many challenges that require managers who represent the social diversity in public institutions as an opportunity to strengthen democracy. This is important in the case of Indigenous People.

TRB has had an important theoretical and empirical development, being introduced by Donald Kingsley in 1944. Lately, Mosher (1968) has had an important influence on research by proposing a differentiation between "passive" and "active" representation. A representative bureaucracy will be *passive* when the composition of bureaucracy reflects the characteristics of its population in terms of race, social class, ethnicity, religion, gender, occupation, or other characteristics. In contrast, a representative bureaucracy will be *active* if it seeks to achieve the interests of a specific segment of the population through concrete actions that contribute to improving the quality of the public implementation process (Kennedy 2012; Morabito and O'Connor 2015). The active representation is influenced by different variables and can be classified according to three types of factors: individual factors, organizational factors, and factors of the sociopolitical environment.

### Individual Factors

For public managers, the perception of sharing the same social origin (ethnic, race, gender, etc.) with citizens positively affects their attitudes, having a greater disposition to promote actions that increase their welfare (Lim 2006). In the indigenous case, belonging to the same ethnic group, coming from the same communities of origin, sharing realities of personal, academic, or professional development, among others, can act as catalysts for identification processes with targeted recipients (Meier and Stewart 1992). Thus, managers spend more time paying attention to those citizens who share their demographic characteristics. Regarding the Chilean case, previous studies show the relevance of shared origins to generate confidence networks in the public policy process. For that, we can point out that ethnic belonging, as well as managers' self-perception concerning their role as representatives of indigenous peoples, could be relevant to analyze.

### Organizational Factors

The active representation of managers can arise from organizational factors related to their autonomy by taking normative or regulatory decisions that favor them (Meier and Morton 2015). Therefore, the occupation of strategic positions is relevant. Also, it is important to give visibility to minorities in the organizational mission. The existence of a body of professionals belonging to these minorities will also favor the empowerment of managers (Calmar 2017). In sum, the literature in the field considers the perception of the existence of spaces of discretion, the institutional design, and the inclusion of minorities in strategic definitions as organizational factors that favor active representation.

### Factors of the Political-Social Environment

Finally, active representation can arise influenced by some characteristics of the environment, being relevant a) the political support and the role of minority interests in political agenda, and b) the ability of political forces to influence decisions. These contribute to the visibility of minorities and empowers senior civil servants by favoring specific policies aimed at these sectors (Selden and Selden 2001), feeling greater political, or social legitimacy. So, environmental factors could catalyze processes of active bureaucratic representation, depending on the place that targeted recipients occupy on government agenda, the valuation of society regarding the policy matter, and the relationship with the citizens, among others.

## TRB in Latin America: Challenges to Indigenous Public Managers from Chilean Case

### The Chilean Context to TRB

For the Chilean case, two analysis dimensions are relevant. One the one hand, the political system is characterized as hyper-presidential, in which the President acts as a co-legislator and has exclusive powers, especially to design and implement public policies without the approval of Parliament. Besides, Chile is a unitary state with a high level of political and administrative centralism, where its bureaucracy plays a preeminent role in the implementation of public policy (Mainwaring and Shugart 2002). On the other hand, the Chilean public administration performance is considered one of the most professional and efficient in the region, with a system of high public management consolidated from a Weberian perspective. For all that, Chile is characterized as "meritocratic bureaucracy" (Zuvanic et al. 2010) that represents a Weberian ideal: officials recruit from open mechanisms, and for their credentials and merits.

From in-depth interviews applied to 25 key actors (between December 2017 and March 2018) who have played a role at different stages in the indigenous policy process in Chile since 1993 until now, challenges to TRB will be analyzed, looking for similarities or differences with Anglo-Saxon experience. The interviews were codified using the NVIVO software.

### Individual Factors

In Chile, Law No. 19.253 recognizes nine ethnic groups that represent 12.8% of the population. Most of the interviewees identify themselves with indigenous people's demands or recognizes themselves as part of indigenous people. Between them, indigenous managers say that they feel proud of their ascendancy especially considering their ancestors, where their ethnic identification can favor the understanding of the interests of the indigenous beneficiaries, contributing to a harmonious relationship with them. In the Chilean case, ethnicity is not only indicated as a factor of pride and recognition, but it also puts indigenous managers in a position of advantage compared to others who do not belong to their ethnic group.

However, ethnicity is not a sufficient condition to obtain legitimacy, where indigenous managers must be careful to represent the interests of the indigenous citizen and government priorities. Therefore, there is no evidence of a correlation between the sense of belonging and activated representation, where belonging seems to be a symbolic issue since the senior civil servants prioritize their role as state officials or representatives of the President, rather than their ethnic origin. In fact, ethnicity is understood as a less relevant factor than political militancy.

Thus, in the Chilean case, there is no activation of bureaucratic representation at the individual level. An element that explains this inhibition is the institutional and organizational structure, specifically, the level of centrality in the decision-making process where the indigenous managers constantly depend on the instructions of the President or Ministries. This could explain why public managers think that it is more important they are politically and hierarchically dependent on the President of the Republic than their ethnic identity. As some indigenous managers indicate, this is because they belong to political parties and is for their political militancy that the President chooses them to be public managers.

### Organizational Factors

In the Chilean case, the President of the Republic and Ministries tend to limit the autonomy of indigenous managers because this area of public policy has an impact in other policy areas (economic, social, etc.). These managers do not have many spaces to introduce changes because they are controlled by political players on different levels. Therefore, it is difficult for them to manage from a strategic point of view since aspects defined at a political level largely dominate their dairy activities, becoming an inhibitor to active representation. Also, it is interesting to note that indigenous managers say they have limitations to dialogue with political decision levels. For that, it is important to them to know the institutional framework to find areas of action with higher levels of autonomy, regardless of informal relationships. In this sense, the relationship with political decision-making levels is important, but to indigenous managers is more important their knowledge or their experience in public administration.

Thus, in the Chilean case, there are organizational limitations to the activation of bureaucratic representation. The indigenous managers have little spaces of autonomy, especially because Chilean political systems are characterized as a hyper-presidentialism. Managers are measured and controlled with the same standards that the rest of public organizations, inhibiting the appearance of positive discrimination toward indigenous people. In this way, it does not exist formal incentives to encourage indigenous managers to focus their agenda on indigenous people's problems.

### Political-Social Environment

Although the indigenous issue has been present on the political agenda in Chile in the last decades, it is not perceived as a relevant policy. This is related to the lack of understanding about what needs indigenous peoples, especially from political levels. However, indigenous demands have been gaining visibility during the last decades, which is reflected in different instruments for measuring social perception as public surveys. One important limitation to indigenous managers is that they do not take the relevant decisions because it is taken by politicians in high spheres, who often decided contrary to indigenous interests. This has put indigenous managers in difficult positions against indigenous targeted recipients, evidencing that exists a tension for them: being a "government representative" or an "ethnicity representative." A relevant issue of the relationship with the targeted recipients of these policies is the difficulty of the indigenous managers to act in an "empowered way" before them, especially because of the limited political attributions that they feel to possess.

Thus, in the Chilean case, the greater sensitivity and understanding of the demands of indigenous peoples has not been reflected in the empowerment of indigenous institutionally. Therefore, there is little "political capital" and "political management capacities" exhibited by managers, so their level of involvement or empowerment in the definition of indigenous policies is very scarce, prioritizing their role as government agents over their self-recognition as indigenous. In this sense, the lack of "political capital" or capacities to impulse a political agenda, with the lack of spaces of autonomy, is an important issue that limits their influence in the definition of indigenous policies.

## TRB in Latin-America: Implications for a Research Agenda

From the Chilean case, the evidence shows that there is no activation of bureaucratic

representation in indigenous public managers. When comparing the Chilean case to other cases in the international literature, it is necessary to point out that the most of cases of active bureaucratic representation come from Anglo-Saxon institutional experience, where there are higher levels of administrative decentralization, and where bureaucrats have greater discretion spaces, so is permitted to guide their action to benefit a certain group. On the contrary, in the Chilean case, which follows the Weberian tradition, the action of bureaucrats is conditioned to political elements, with limited spaces of autonomy, which restricts the activation of bureaucratic representation. Therefore, only a passive representation of indigenous people is evidenced.

As in other Latin American cases, the concept of TRB has been rarely used in academic debates (Pardo 2013) but we can find some experience to promote its implementation in public administration. However, Chilean experience shows that this has not been implemented from a systemic perspective, rather than as specific decisions. The evidence shows the non-activation of bureaucratic representation in indigenous managers could be explained mainly by organizational factors than individual factors. The Anglo-Saxon experience shows the relevance of ethnic belonging. However, in the case of Chile, although the bureaucrats feel part of indigenous peoples, it is the loyalty to political authorities and to principles of Weberian structure that prevail. In that case, it is the organizational dimension the first inhibitor to an active representative bureaucracy, especially because of the limited spaces of autonomy that the managers have. In the Chilean case, it is necessary to have a structural change in the political and administrative design to decrease the rigidity of the Weberian model and to deliver greater areas of autonomy and discretionally to indigenous managers.

This evidence is relevant for the Latin American case as well, where the principles of the Weberian model can influence the success of initiatives that seek to promote greater representation of today's diverse societies. Research in the TRB area is still incipient in Latin America. However, its progress could generate diverse contributions to a better understanding of the emerging problems around indigenous peoples, from making new dimensions of the problem visible to providing diverse solutions to long-standing demands.

## Activity-Based Costing in Public Services

Danilo Tuccillo
Department of Economics, Second University of Naples, Naples, Italy

### Synonyms

Cost activity management; Process accounting

### Definition

The activity-based costing, applied in public services, is a full costing method which recognizes the relationship between costs, activities, and products/services of a public administration.

### Introduction

A cost accounting system aims to provide to an organization relevant cost information, related to product and services, to support the decision-making process.

Traditionally, the cost accounting system of an organization was designed to support the needs of financial (external) reporting and to help the determination of a satisfactory price for goods and services sold. When traditional methodology has been developed, direct labor and materials were the most significant product or service costs, with overhead costs that engraved only with a small percentage of total costs.

But the functions of a cost accounting system have not remained unchanged over the years. In the last years, the productive process – in large sectors of economy – has been characterized by a progressive reduction in labor and material costs and a very intensive use of technology. With this shift of resources, the overhead costs have become a significant portion of the total costs. Then, the allocation of these cost to product and services, if don't comply with causality principle, produces cost information that is not effective because it does not reflect the use of the organization's resources (Kaplan and Johnson 1987).

The traditional cost accounting system has not evolved to recognize changes in the productive process. With this kind of methodologies large amount of general costs are allocated to products and services on a single allocation base, substantially related directly or indirectly to the volume of production, for which the cause-effect relationship is no longer as precise as it should be (Brown et al. 1999).

In this setting, the traditional system is not providing accurate cost information, while the activity-based costing may provide the structure for the establishment of a true management-oriented system. The ABC approach gives a better view of the relationship between resources, activities, and products/services; using multiple drivers to assign overhead costs to the activities allows a better allocation of this costs. Furthermore, a more comprehensive allocation of the resources, based on the cause-effect relationship, allows to manage and reduce them without necessarily reducing the quality.

In recent years, government organizations have begun to look to private sector to improve their business practices and their efficiency in resource use. The pressure to initiate public sector reforms, under the development system promoted by the new public management (Hood 1995), increased often the outsourcing choices, with a new scenario in which public goods and public services are provided both by public and by private entities. When an institution, public or private, has to operate in an increasingly competitive environment, it is very important to look for useful tools providing information for decision-

making process accurate and relevant, particularly for those decision that affect the level of costs. In the public sector in fact, it is possible to observe a growing pressure for reducing the cost production of public services; against the background of declining tax revenues, local administrations have to deal with improving and redesigning their work routines (Becker et al. 2010). Also local administrations can improve their financial management by adopting activity-based cost accounting systems that measure not only their inputs but also their outputs (Granof et al. 2000).

Activity-based costing is one of the most important tools being introduced in the effort to achieve these ends, in a time in which public sector organizations at all levels are facing intense pressure to do more with less. This require to understand costs; efficiency and performance, once reserved to private sector, will increasingly be part of the language of the public sector (Cokins 2006).

## The Construction of ABC System

The activity-based costing is an approach for costing and monitoring of activities which involves tracing resource consumption and costing final output. The basic idea is to change the way to allocate overhead costs to outputs beyond the traditional distinction between fixed costs and variable costs depending on the quantity produced, focusing on the "complexity costs." It is a different view of the costs allocation process that permits to go over the simple distribution of indirect costs as a percentage of direct costs.

In this view, the business processes are considered as a set of activities that accepts inputs and produces outputs. To obtain products and services, companies need to implement these activities by using their resources. The consumption of more or less resources is related to the factors that cause the need of more or less activities. Are those ones that, in order to produce products and/or services, generate costs. In public sector it is possible to use the same approach: The aim of public administration is to produce goods and services for the citizens, and often it are exchanged in the market; however, the absence, for many public services, of a selling price or of a remunerative price does not influence the ABC process. Besides, it could be different the use of information or the objectives of the analysis.

In a public administration the ABC process can be summarized into six interrelated steps:

(a) *Indentifying Activities*.

Activities are aggregation of homogeneous actions or single operations that are interrelated because they produce a single output by using the same resources. An activity is well defined if, by observing it, it is possible to record who carries out the single operations, using which kind of resources, and what is the (measurable) output at the end of these operations. All the operations must be aggregate in activities: The final goal of this step is to have a map of all the activities implemented. It is recommended to avoid a wide aggregation of operations, or that individual activities are constituted by a high number of operations. In this case, in fact, the drivers identified in phase sub (b) may not adequately represent the factors that cause the consumption of the resources by the activities.

Another important aspect concerns the interconnections among different activities: indeed, the mapping process should highlight any links between the activities developed for satisfying the citizens' demands.

(b) *Identifying Resource Cost Drivers*.

The resource cost driver should be able to transform the expenses of resources (e.g., salaries, supplies) into the costs of the work activities. A cost driver is any factor that can cause a change in the costs level of an activity. The objective of this step is to determine the sources of expenses that affect each activity: by observing the increasing or decreasing costs in a time frame is possible to identify the elements that cause these increases or decreases as the elements that drive the change. At the end of this step for each activity are defined the drivers that describe the cause-effect relationship between activity implementation and resources consumption.

The drivers must reflect the different characteristics of the resources: for employees they should reflect the time people spend performing work activities, while a resource driver for indirect material purchased items reflect their usage by an activity, such as energy expense's kilowatts by a machine.

(c) *Assign Resource Cost to Activities*.

Preliminarily, the cost of resources is classified in direct and indirect cost: direct costs are allocated to the activities without the needs of any assumption, while indirect costs are assigned to the activities using the resource cost drivers. The indirect costs are aggregate in homogeneous cost pool, and for each cost pool is individuate an appropriate cost driver. In this way, each activity could have one or more cost driver: these parameters, due to their attitude to explain the cause of increase or decrease of costs (of a single cost pool), lead the allocation of the cost of the resources to the activity. The output of this step is the calculation of the cost of each activity, as consequence of its absorption of resources.

In public sector it has to evaluate whether to proceed to a full costing type indictment: it would be recommended for a correct amounting of production costs of public services that some of the institutional operating costs (e.g., the town council operating costs) are excluded from indictment.

Alternatively, deciding to keep the full costing approach of the activity-based costing, it could be possible to divide and classify the activities into:

- *Primary activities*: These are activities whose output is directly connected to the production of goods or related to the provision of services required by citizens.
- *Secondary activities*: These are all the activities that support primary activities.
- *Mandatory activities*: These are all the activities which should be carried out due to legal obligations.
- *Discretionary activities*: These are all the activities connected with the government policies and strategies, which are affected, therefore, of specific choices of politicians and managers called to implement the political guidelines.

(d) *Recognition of cost objects*.

Cost objects should reflect the reason of the analysis. The flexibility of ABC system allows to adapt the target of observation to the informational needs. Public managers should need information related to single public goods or services to evaluate the level of resources consumed and the level of quality reached. But the cost object may be also represented by all the services provided by each department of a local administration, rather than specific territorial areas. Defined the cost objects, the direct cost as labor or material is assigned directly to them.

(e) *Identifying Activity Cost Drivers*.

The activity cost drivers are the factor that can cause a change in the level of the requested unit of activity. The objective of this step is to determine the sources of the consumption of each activity: by observing the increasing or decreasing of demand of activity in a time frame it is possible to identify the elements that drive the change in demand level, generating the need of more or less unit of output of an activity. These drivers describe the cause-effect relationship between cost objects and activity consumption. In the public administrations, these drivers should be the result of a process of benchmarking with similar entities.

These drivers are conceptually very different from the "resource drivers"; an activity driver should reflect a measure of the output of an activity. Some examples could be: the number of documents related to the activities of registration or the number of payment order for the expenditure management, even the number of certificates issued by a certain office for advice activities, certifications, concessions, etc.

(f) *Assign Activity Costs to Cost Objects*.

In this step, the costs of activities are transferred to the cost objects in function of the activity cost drivers.

All the operations which express the consumption of activities by the cost objects,

constitute the bill of activities (BOA) of a product, of a service, or of another cost object.

In a BOA must be listed the compulsory activities and what it is necessary to achieve a product, a service, or another output. The quantity must be expressed through the number of outputs of the activity used to obtain a unit of product/service/output. Knowing the unit cost of each activity included in the BOA and determining the uses required by each cost object, you can determine the part of activity absorbed by different products and, consequently, the cost share of each activity to allocate to each cost objects.

## Advantages and Limits of ABC in Public Services Management (Conclusion)

Previous studies have shown that ABC is useful in two situations (Cooper and Kaplan 1988):

(a) When organizations have growing expenses in indirect and support costs, with a traditional cost accounting system that is based on the assumption that cost objects consume resources, and it is generated prevalently by direct labor and materials.
(b) When organizations have several products, services, and processes, as typically registered in public administrations.

In public entities, the management is often inspired by a financial/monetary logic rather than economic, and therefore lacks a constant focus on economic rationality. The decision to acquire effective tools of economic analysis stressed on results, with which to guide and empower the public managers, is a need in the various levels of public administration. It represents the result of the need to have appropriate tools to measure economy and efficiency. This means that it is necessary to implement a major overhaul of management accounting systems for public services that leads to a constant search for the best utilization of the resources. On this topic the management accounting system assumes great relevance: it is able to promote this constant search identifying the processes on which managers could and must intervene. However, to effectively realize this intervention is necessary to have adequate managerial tools; in particular, the cost accounting system must be able to recognize the expenses and revenue of public services.

Activity-based costing is now an accepted element of the accounting and control systems of industrial and service firms, and it has been employed in both governmental and not-for-profit organizations. The characteristic of public sector organizations, as overhead-intensive service entities, suggests the use of ABC. The adoption of ABC in private sector was propelled by increasing proliferation of all businesses outputs (including types of suppliers, products, services, channels, and customers) that cause increased complexity and increased indirect expenses to manage the complexity. For public administrations the variety of services offered, of suppliers and the cross-sectored demand of various category of citizens with differentiate needs is not an effect of transformations in its own environment, but rather a characteristic of its own activity.

*From the public managers and politicians' perspective*, the ABC allows a more detailed and accurate analysis of overhead cost, with a direct connection between services-outcomes, resources necessary to implement activities, and factors that consume them. An analytical map of activities and a detailed cost analysis represent a great help for budgeting.

By analyzing all the activities, ABC is able to provide the administration information about the contribution of each activity in value creation for citizens: for an effective cost-benefit analysis, this methodology describes better than traditional cost accounting the ability of activities to improve services quality and those of them that contribute less or cost more than their contribution. This characteristic of ABC help to match the actual need of efficiency in public service management: with different kind of representation, all citizens require to pay less tax without a decrease in public services quality or to have an increase in public services quantity and quality holding the line on taxes.

Moreover, the obtained cost rates can be used for cost control, for managers' evaluation, for comparing administrations and, with a forward-looking approach, to evaluate the cost benefits of the strategic decisions planned. ABC, by assigning costs to previously unmeasured factors in decisions and providing a measure of the full cost of programs and activities, helps to identify circumstances in which goals and objectives are out of line with spending decisions.

ABC resolves the problem inherent to the lack of useful information in the general ledger by converting accounting data in activity costs. This costs reprocessing can be used to identify operating relationship that represents the key elements to making good decision affecting products, services, and citizens.

*From the citizens' perspective*, the last years were characterized by an increase in public services quality obtained mainly by using new technologies; however, the citizens perceive yet these services as too expensive and often of a low quality. It is widespread but very relevant in countries where a large part of citizen transaction is done with the public administration.

The cost accounting tools, and particularly the activity-based costing, with its capability to analyze and to classify activities and actions, can help the change in the public administration (PA) by analyzing each part of local government and promoting mechanisms of improvement. The citizens have certain legitimate expectation of the standard and quality of services, and the government should be able to deliver them. As taxpayers, the citizens-consumers can evaluate through a cost accounting system able to produce relevant quantitative information, the level of effectiveness of instruments as the "citizens charter," adopted by several governments to set out in a transparent way the standards and the types of services that are being offered (Rizvi 2008).

According with the need to improve accountability in the PA, ABC, linking budgets with performance, allows a better evaluation of the results of the political choices. Furthermore, the standardization and the simplification of administrative processes can constitute one of the powerful mechanisms of transparency; a well-defined and knowledge procedure is an effective weapon against corruption.

Despite its advantages, the activity-based approach has also several limitations, including that of being very complex to apply. And probably, in the public sector this complexity is harder than in private sector. Its introduction in fact requires a thorough organizational analysis to identify and define the activities. This analysis may also have a high strategic and organizational value, allowing to appoint the activity owners with the aim of rationalizing the activities of which have identified as leaders. However, it is an analysis which takes time and requires the involvement of a plurality of persons. Some activities may not coincide with the cost and responsibility units defined according to the functional vision. Furthermore, if there is already a traditional cost accounting system, this will require significant changes, and investments, in procedures, softwares, and behaviors. Furthermore, in designing a costing system, there is always a trade-off between the cost of the system and the detail, accuracy, and flexibility of the system. ABC implementation is expensive for all kind of organizations, particularly in the public organizations, where often the public relevance of the outputs requires more complex procedures. The desired level of detail and accuracy of information, affecting directly the level of costs to be sustained, depends on what decisions will be made.

The introduction of this approach requires that the public decision-makers understand fully the strategic significance and would exploit all the potential uses of this methodology. The final objective of this approach, in fact, cannot be only to calculate the "true" cost of public services. The awareness of the politicians and of the top management of public entities is required on the potential use of information activities in order to define effective strategies and resource reallocation policies, compose outsourcing choices of activities, and/or redesign activities and processes. To achieve this awareness is often necessary to start the process of training and awareness from decision-making levels.

# Adaptive Public Administration

Ani Matei and Mădălina-Cristina Gogu
The National University of Political Studies and Public Administration(SNSPA), Bucharest, Romania

## Synonyms

Adaptive governance; Adaptive institutions; Responsive public administration; Transformation of Public Administration

## Definition

The term adaptive administration describes what happens when administration adjusts to change, theories evolve and contribute to practice insights, and the results of practice experience are used to modify the theories being used (Mitchell and Mitchell 2015).

## Introduction

In the last period, the public sectors have undergone fundamental transition due to the financial stress, digital revolution, globalization, and political polarization, affecting the evolution and development of public policies and programs (Matei et al. 2017, p. 764). Thus, public administration must adapt, both now and in the future, to the turmoil in the environment, economy, and politics; to social unrest and military confrontations; to the lack of drinking water, the food crisis, and the difficulty of citizens to access medical services; to pollution, stress, new viruses and bacteria, terrorism, strong and large-scale fires, catastrophic floods, and large-scale earthquakes; as well as to the occurrence of phenomena and processes with a high risk to human health and life (Gogu 2018).

The concept of adaptation has quickly gained ground among theorists and practitioners in public administration. The special interest shown in adaptive public administration requires a better knowledge of the problem in order to understand and solve the problems that the public administration will face. The transformation of the public administration into an adaptive administration is done through two complex processes, namely, adaptive management and adaptive administration. Adaptive public management is an integrative process of induced transformations in public administration, in which change, adaptation, and innovation are dominant features (Matei et al. 2017), and, at the same time, it is an iterative structured, decision-making process, robust when faced with uncertainty, in order to reduce uncertainty over time by monitoring the system (Holling and Sundstrom 2015). Adaptive administration is, in turn, a dynamic, conscious process that allows external and internal changes to induce and operationalize new statuses for public administration, in order to respond to the sociopolitical context . (Matei et al. 2017).

The process of transforming public administration into an adaptive administration is based on the concepts of Holling and his colleagues (1978) and also on the theories advanced by both the authors Mitchell (2015).

## Adaptation of Public Administration

Adaptation of public administration consists in the application of adaptive management which is a formal iterative process of resource management that acknowledges uncertainty and achieves management objectives by increasing system knowledge through a structured feedback process (Matei and Antonie 2015). The adaptive public administration represents the most adequate framework for operationalizing the adaptive public management (Matei et al. 2017, p. 776).

Adaptation of public administration consists in the application of adaptive management, which is a formal iterative process of resource management that recognizes uncertainty and achieves management objectives by increasing system knowledge through a structured feedback process (Matei and Antonie 2015). Adaptive public administration is the most appropriate framework for operationalizing adaptive public management (Matei et al. 2017).

Figure 1 shows the stages of public administration transformation, which must constantly adapt, if it wants to remain relevant as a field (Mitchell and Mitchell 2015); thus, the objective is to transform the administration, from a rigid administration to an adaptive administration (Gogu 2016). The stages, described in Fig. 1, are iterative, there is no final stage, and the adaptation to new realities continues permanently.

Public administration is difficult to define (Rosenbloom 1989) due to the impossibility to include in a definition the multitude of administrative facts and the diversity of aspects incorporated by administrative phenomena (Matei 2000). The essence of public administration is the translation of politics into the reality that citizens see every day (Kettl and Fessler 2008).

Adaptation of public administration is done in three stages, namely:

1. Public administration
2. Understanding the behavior of public administration
3. Evaluation and design of adaptive public administration

The first stage takes place within the current public administration; in this stage, the work team is established, the necessary data are collected, and the organization of the public administration system is analyzed.

The work team consists of two or three analysts, with training in public administration, administrative law, economics, communication, etc., who have experience in integrating information and coordinating people. The team must be supported by a support group of up to two people. The team refines the models, develops alternative policies, and analyzes the data, while the support group collects and integrates the data. The analysis of the organization of the public institution is presented in several successive workshops, in which a maximum number of 20 scientists, managers, and politicians are involved. The decision-maker, usually the head of the public institution under analysis, is only involved in key points for short periods of time (Holling 1978).

In the second stage, entitled "Understanding the behavior of public administration," the work teams analyze the institution in terms of stability and resilience, complexity and simplicity, etc. Understanding behavior can be decisive for the development capacity of institutions (Matei et al. 2017, p. 775). In terms of behavior, public institutions are grouped into institutions that have a sustained pace of change, that respond flexibly and adaptively to any type of uncertainty, and that maintain stability at all costs and exclude disruptions and risks from their work (Holling 1978). In adaptive practice, an institution is not validated, but first it is invalidated, by endangering it, so as to call into question the credibility of the functioning, in good conditions, of the institution in situations of uncertainty, to see where fails. The creation of a model, of a public institution, to function in the real world, must not be too simple, because it has no credibility or must be made at the level of detail, because the real world changes between the moment of the model

**Adaptive Public Administration, Fig. 1** The stages of transforming the public administration into adaptive public administration

and the establishment institution. The adaptive approach to the problems for which an institution is set up uses, on the one hand, an adequate degree of complexity to approach the model in real life and, on the other hand, uses creative simplification, due to the requirements of understanding the model, critical evaluation, and communication (Holling 1978). An action taken by an institution currently changes future realities and decisions, so it is necessary that the present action does not contribute to the establishment of realities that can no longer be adapted in the future; in this sense, it is necessary that any action be adaptively evaluated and to identify a part of the actions that will be undertaken, obligatorily, in the future, as a consequence of the present actions.

In the third stage, entitled "Evaluation and design of adaptive public administration," the public administration and its adaptability are evaluated, working models are built, the processes that will take place are described, and the institutions are designed for future uncertainties. Assessing the impact of uncertainty on the activity of public institutions does not aim at eliminating uncertainty but only a recognition of the inevitability of uncertainties and the consequent selective risk-taking (Holling 1978). Evaluation and design involve changes in institutions and legislation; these changes are more feasible in developing countries and less so in developed countries (Holling 1978). Public institutions must be designed to cope with large, impossible-to-eliminate disasters and to learn from small-scale disasters. The purpose of design is, first of all, to prevent and, secondly, to survive when a failure occurs. In the evaluation and design stage, the world must be seen from the perspective of adaptability, responsiveness, and uncertainty, as fundamental aspects of life, rather than prediction and

tight control aimed toward an achievable certainty (Holling 1978). The adaptability capacity of institutions is determined by their ability to learn and store knowledge and experience, by their creative flexibility in decision-making and problem-solving, and the existence of power structures that respond to and take into account the needs of all stakeholders (Matei et al. 2017).

## Adaptive Public Administration

In the fourth stage, the technical stage, entitled creating the database and the knowledge base, the institution is equipped with Big Data systems, adaptive computer programs, knowledge bases, and theory generators. The technical capacity of institutions to equip themselves with high-performance systems consists in the ability to implement all of the key organizational functions and deliver programs and services (Matei et al. 2017). Big Data information systems pre-process the received information and store it in the database in a format that will be used later; it also post-processes information, using logical algorithms. Knowledge bases, created with the help of Big Data, have the potential to revolutionize the field of administration because they can contribute with answers, in real time, to the questions of the heads of public institutions (Mitchell and Mitchell 2015). Data analysis methods, from knowledge bases, rely on qualitative modeling and typological analysis and involve a combination of typological scales and search tables to create representations of interactions between concepts that may vary over time (Mitchell and Mitchell 2015). A computer program is adaptive if it automatically changes its operating algorithm and sometimes its structure, in order to maintain or achieve an optimal state, when the external conditions change (Ciobu 2014); the program must be adapt to present and future situations. Adaptive software uses available information about changes in its environment to improve its behavior (Norvig and Cohn 2021). The theory generator, on the one hand, eliminates the rigid theories proposed to be applied in practice, which are often irrelevant, thus being useless because they are inflexible (Mitchell and Mitchell 2015), and, on the other hand, must produce, with the help of a computer mechanism, useful theories in practice about certain topics and problems, theories that adapt to the existing situation at a given time and a well-defined place. This process of producing theories from experience and making them available to practitioners is an adaptive process and produces adaptive concepts.

Adaptive public administration must adapt to risks, constraints, challenges, frustrations, and stress; solve dilemmas; manage cooperation and conflict, rigidity, and flexibility; adopt adaptive strategies; and develop and apply administrative-practical theory (a-p).

The ability of the administration to adapt and accept the changes that take place both outside and inside the institution and the ability to overcome crises, achieve performance, and get closer to the citizens will be an important pillar of efficiency (Matei et al. 2017). Changes that take place outside the institution receive different responses, and the risks can vary substantially from institution to institution. The heads of public institutions need to assess the advantages, disadvantages, and risks associated with the various options and engage in effective risk management. Public institutions that have adopted rigid strategies in their activity are subject to a certain type of risk; at the same time, the institutions that have introduced adaptability in their activity are subject to another type of risk. Doing nothing is usually associated with a significantly higher risk than in the case of institutions that have implemented adaptability in their work (Mitchell and Mitchell 2015).

Some of the constraints to which the institutions are subject are closely related to the costs, as well as to the social benefits realized; any decision that the leaders of the institution take involves numerous evaluations and risks but also compromises both qualitative and quantitative. Decision management is done intuitively by the leaders of the institution. Experienced leaders make quick decisions, based on the intuition developed from experience gained, but it would be much more useful for the institution if a decision was made based on information received from a knowledge

base (Mitchell and Mitchell 2015). Other constraints to which public institutions are subject are of a physical nature, such as the proper arrangement of work spaces. Although considered a minor fact, compared to the main activity of the institution, the arrangement of spaces can have a major impact on institutional performance and individual staff reactions that can affect both labor productivity and job satisfaction (Mitchell and Mitchell 2015).

The category of challenges, both for the institution and for civil servants, includes the use of Big Data, new technologies, theory generators, as well as administrative-practical theory (a-p).

Relationships within an institution, as well as relations with the outside world, with other institutions, and with citizens, are based on forms of cooperation, conflict, or a combination of the two. Internal cooperation, between the staff of an institution, and external cooperation, with other institutions, contribute to the elimination of conflicts and to the increase of the efficiency in activity. There are many degrees of cooperation, from full commitment to extreme caution; it all depends on the interests of those involved. If the staff of an institution decides that it is in their interest and they are satisfied when decisions are approved by all those involved, then there is cooperation. As the internal and external environment of an institution changes, cooperation becomes difficult, in which case an adaptive dispute settlement procedure is needed. As in the case of cooperation and conflict, there are degrees of conflict, between citizens, officials, groups, and institutions, from open warfare, hidden opposition, lies, etc. Conflicts are considered normal and accepted, and efforts are made to collaborate more through the use of adaptive administrative strategies (Mitchell and Mitchell 2015).

The reaction to changes outside the institution can be characterized as flexible, rigid, or mixed; some reactions are instinctive and others can be planned. Rigid reactions maintain institutional predictability, are part of the same way of solving situations, and are on already established capabilities and values. Adaptive reactions allow the institution to evaluate and change its activity in response to changes that occur. The slower introduction of change allows for greater stability, and, vice-versa, greater adaptation to change reduces the stability of the institution. It takes good cooperation between theorists and practitioners so that the theorists understand the real world and for the practitioners, the leaders of institutions to understand what mix of strategies should be applied (Mitchell and Mitchell 2015).

Frustration and stress are manifested, both among leaders and civil servants, due to the lack of available information on how the activity of institutions can be improved and, among citizens, due to the relationships they have with public institutions, relations considered by them as inflexible, arbitrary, burdensome, and intrusive. Leaders often feel that they lack a knowledge base that makes choices in decision-making easier, helps them solve problems, and provides them with methods that could be applied in everyday practice. Citizens do not understand how public institutions work and why they do so in a rigid way; at the same time, the heads of institutions and civil servants feel threatened by the wave of criticism, both external and internal; and in this case they do not takes risks to improve the activity preferring to act rigidly, in a strictly legal framework (Mitchell and Mitchell 2015).

There are two dilemmas regarding the path that leads the public administration to the desired results: the first of them represents the way of managing, at some point, in the future, the activity (rigid or adaptive), and the second represents the way to get from here, from the present, up to there, in the future. The disadvantage of jumping to the future is that today there is no certainty about where the institution should go, what methods should be used to move us in a new direction, and what the risks are if major changes are made (Mitchell and Mitchell 2015).

The performance of a public institution must be effective and efficient, in accordance with the imposed standards; in this sense, the leaders need information, both quantitative and qualitative. This information can be provided by a relevant, ever-changing knowledge base but also by strong support systems built around knowledge bases. In the current public administration, leaders are usually left on their own, to

cope with the realities of their functions; all this limits flexibility and reduces the performance of leaders of public institutions. The need for a knowledge base appropriate to a sector of activity is essential; from this, base managers can access information and suggestions, as well as from an online consulting service. This approach is specific to adaptive administration and administrative practice theory (a-p) (Mitchell and Mitchell 2015).

The experience of the staff of a public institution contributes a lot to the performance achieved by the institution in its entirety, because the experience contributes to the efficiency of the practice and the practice contributes to the enrichment of the theory. The lessons learned can be understood, generalized, and added to the database of the field of activity only if references are made to appropriate reference theories; only in these conditions, the lessons learned can build bridges with other experiences. The experience incorporated in the lessons learned represents an intermediate step in linking the theories of practice and the use of practice in improving the theories (Mitchell and Mitchell 2015).

The strategies that the adaptive public administration must adopt concern the fields of planning, personnel, financial, management, etc.

Planning begins with the activities carried out by legislators when drafting new laws in the field and continues with the decisions taken by political leaders in government, on what public institutions should do, and in the last part the legislation and rulers' decisions are implemented, and it aims to be framed within the limits of the approved budgets and the time frame for which the budget was approved. Adaptive planning explicitly takes into account the uncertainty at the time of drawing up the plan, respectively, and analyzes the reaction of the planned system, on the one hand, and the limited knowledge of the planner, on the other hand. In adaptive planning, new information and feedback are quickly and continuously integrated into the plan, planning does not end with the approval of the plan but continues throughout the implementation, and the management, each time, is adjusted accordingly (Mitchell and Mitchell 2015).

Changes that take place in society affect public institutions and the relationship between institutions and its staff. Personnel strategies develop, among the staff of an adaptive public institution, understanding, skills, and motivation, in order to ensure compatibility between the institution and the staff working within it. At the same time, it is necessary for staff assessment to adapt to new circumstances, the assessment must be made in terms relevant to the situation that a public institution is facing, and the assessment methods must be reviewed as part of the adjustment process (Mitchell and Mitchell 2015).

Under the conditions for the introduction of adaptive administration, new requirements for financial and budgetary planning, accounting, and reporting should be introduced. Permanent change forces public institutions to react and correlate financial plans with the new situation. The budget, in conditions of uncertainty, is no longer relevant, and accounting becomes much more difficult as new categories of expenditure appear, and the funds available for such expenditure are neither foreseen nor correctly classified. A major problem is financial reporting, which must justify why planned expenditure does not correspond to expenditures. Applying the current method, in the conditions of permanent changes, would mean that the financial plan is applied as foreseen at the time of its approval, without any adaptation, although the situation has changed and the results obtained will be far from established. The application of adaptive management in the financial field of public institutions should reconcile, by flexibility, standard financial strategies with the requirements of adaptive administration, which is difficult to achieve due to the rigidity of public administration. One solution to counteracting rigidity would be to include footnotes in current financial plans describing how the occurrence of unforeseen events may change the destination of funds or the source of revenue. Permission to change the destination of the funds, based on the footnotes, in the event of unforeseen events, may be granted by the law that approves the respective budgets. A better solution would be to aggregate budgets at a higher level, which means that the source of revenue and the destination of

expenditure would no longer be provided in detail. The latter proposal would lead to the development of a new type of accounting and tracking of income and expenditure, as well as another way of financing work teams (Mitchell and Mitchell 2015).

The management of the institutions must look, both to the inside of the institution (the staff of the institution and the activities it carries out) and to its outside (citizens, the environment, politics, etc.). Many challenges face the head of a public institution such as pressures due to limited funding, criticism of citizens and the business environment; the reputation, difficult to maintain, of the institution; and the lack of a knowledge base in the field of activity (base that provides better information about the institution and the outside world). The introduction in the institutional practice of the concept of administrative-practical theory (a-p) would help the leadership to better understand how leadership can be effective in conditions of uncertainty (Mitchell and Mitchell 2015).

Administrative practice theory (a-p) is based on the fact that both theory and practice are constantly evolving, they are not separate and distinct, and they are interconnected and codependent; the relationship between theory and practice is unique and must constantly evolve together to effectively address the changes facing public administration (Mitchell and Mitchell 2015). Theories that present fixed concepts, as true, both now and in the future, are not useful in adaptive public administration. Updating theories can only be done with the theory generator. Such a tool ensures the collection, from practice, of new information, which it models, thus producing new theories about certain topics and problems, theories that are constantly evolving (Mitchell and Mitchell 2015). The term administrative-practical theory (a-p) can include any concept of administration. The theory must be based on generalizations of practical experiences and, in turn, must be available to practitioners to directly support their activities; theories must be seen as variables, not as absolute ideas (Mitchell and Mitchell 2015) as the new theory it is presented and the practice must also change.

## Conclusion

Adaptive public administration has both the tools and the capacity to cope with financial stress, the digital revolution, globalization, political polarization, and the turmoil that takes place in the environment and society. The adaptive transformation of the public administration consists, firstly, in the evaluation of the institutions and their adaptive design; secondly, in the equipping with Big Data systems and adaptive computer programs, on the basis of which databases and knowledge can develop, and with the help of theory generators to make functional the administrative-practical theory (a-p); and, thirdly, in the creation of tools; adaptive reaction to risks, constraints, challenges, frustrations, and stress; solving the dilemmas that appear in the functioning of institutions; managing cooperation and conflict, rigidity, and flexibility; as well as adopting and implementing adaptive strategies in areas such as planning, personnel, financial and leading management, and others. The adaptation of the public administration is an iterative process, and it does not stop because the causes that contributed to its appearance do not disappear either.

# Addressing Food Insecurity: Role of Community Mapping

Veronica Adams-Cooper
Master of Public Administration Program, Albany State University, Albany, GA, USA

## Synonyms

Asset mapping; Food availability; Food security; Neighborhood mapping

## Definitions

| | |
|---|---|
| Community mapping | It is defined as the creation of physical or computer-generated visual maps of assets in communities by local stakeholders, external entities, or a combination. |
| Food access | It is defined as access to sources of healthy, nutritious, and affordable food in a resident's living environment such as grocery stores, supermarkets, and supercenters. |
| Food desert | It is defined as the lack of access at the neighborhood level to healthy, nutritious, and affordable food. |
| Food insecurity | It is defined as the situation that exists when all people, at all times, do not have physical, social, and economic access to sufficient, safe, and nutritious food, which meets their dietary needs and food preferences for an active and healthy life. |

## Introduction

Food insecurity is one of the major challenges of urbanization in nations across the world. It is a complex, global phenomenon that destabilizes the healthy, sustainability of the world population. The COVID-19 Pandemic emerging in 2020 has exacerbated the food insecurity crisis even more (Erokhin and Gao 2020; Shanks et al. 2020). This entry will discuss the role of community mapping in addressing food insecurity in the urban cities of the USA. First, an overview is provided on the role of urbanization in food insecurity. A discussion follows on food insecurity globally and within the USA. Next, a brief review is given on community mapping encompassing these major organizations identified in the case descriptions that provide technology services or data for the development of the food security mappings: Environmental Systems Research Institute (ESRI), Feeding America, PolicyMap, UrbanFootprint, Urban Institute, and the US Department of Agricultural Economic Research Service (USDA ERS). Finally, nine case descriptions are presented that describe community mapping utilization to address food insecurity in urban settings in the USA. The case descriptions involve the following eight states and nine cities: Fresno, California; Albany and Atlanta, Georgia; Boston, Massachusetts; St. Louis, Missouri;

Philadelphia, Pennsylvania; Providence, Rhode Island; Memphis, Tennessee; and Milwaukee, Wisconsin.

## Urbanization and Food Insecurity

Globally, 56.2% of the world's population lives in urbanized areas with projections rising to 60.4% by the year 2020 (UN-Habitat 2020). Urbanization refers to the considerable population shift of people residing in rural areas to living in urban or city areas. The process of urbanization creates changes in local ecosystems (Gianotti et al. 2016). Changes resulting from urbanization often include usage strains on natural environment resources such as land and water. Additionally, urbanization can result in access challenges regarding built environment resources inclusive of but not limited to food supply, infrastructure, housing, employment, and services such as public transit. Social environment factors stemming from urbanization may pertain to wage disparities and differential access to quality education and physical and mental health services.

At the global level, food insecurity resulting from urbanization is related to the influx of population to urban cores to fill jobs created through industry and corporate economies. However, most unplanned urban centers do not have the infrastructure to support the citizens. One international example of the challenges of urbanization is China, known for its densely populated urban centers. Li and Cao (2020) discuss how China's traditional urbanization period from 1978–2012 involved the expansion of urban space. The space was utilized to house industry and corporate growth that benefited from tax and wage benefits provided by the local governments. The populations that flowed into the cities from the rural areas did not necessarily benefit well in terms of quality of life issues. Subsequently, new urbanization began in 2012 with the development of, "The National New Urbanization Plan (2014–2020)," that aims to improve the needs and living standards for citizens that should address such issues as food security, wage inequities, and physical and mental health wellness.

For the USA, urbanization that began in the eighteenth century was the result of the influx of populations to inner cities in response to the Industrial Revolution. Subsequently, industry was replaced with corporations driving the urban economies. However, the residential living patterns shifted from urban city employees with the financial means moving to the outskirts of the cities into the suburbs. The occurrences of suburbanization (Hortas 2015) and white flight (Wade 2017) were especially prominent during the period 1970–2000. The economic impact of this population shift was significant disinvestment from many urban areas leading to closures of grocery stores that substantially diminished access to quality and affordable food for residents (Deener 2017).

When well planned and executed, urbanization is not automatically a threat to urban areas (UN-Habitat 2020). In regard to food insecurity, urban areas have to improve the design of cities to adequately support the food accessibility needed by the population. Seto and Ramankutty (2016) see employing urban planning and land use policies as a means of increasing food security. Citizens must have stores available with healthy, nutritious food options that are affordable. Additionally, urban areas with high levels of wage gaps must find solutions for affordable food opportunities. Even if there are accessible food choices, if residents are unable to afford local, available food and produce, the problem is still present. Concerted and collective efforts by businesses, government, and citizens will be required.

## Overview of Food Insecurity Globally

For almost the past 50 years, the Food and Agriculture Organization of the United Nations (FAO) has been fighting to decrease food insecurity. The significance of food insecurity as a critical condition impacting the world is evidenced by millions of people experiencing the lack of quality food access across the globe (FAO et al. 2020, p. xvi). Data from FAO (2020) reveal that in 2019, approximately 750 million people suffered severe

levels of food insecurity. That occurrence is an alarming rate of about one in every ten persons in the world suffering from a critical level of food insecurity (p. xvi).

Food security was initially defined during the 1974 World Food Summit in response to the extensive food shortages and famine occurring in many parts of the world between 1972 and 1974. By the 1996 World Food Summit, an ambitious goal was set to address food insecurity by reducing 50% of persons experiencing hunger by 2015 (FAO 2006). At that time, approximately 820 million persons worldwide were impacted. During the 1996 Food Summit and subsequently in 2001, the definition of food security was revised resulting in the conceptualization of food security now used to combat global food lack in both urban and rural environments. The definition is, "food security is a situation that exists when all people, at all times, have physical, social and economic access to sufficient, safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life" (FAO 2003). Reflected in this latest iteration of food security are four key dimensions: (1) physical availability of food, (2) economic and physical access to food, (3) food utilization, and (4) stability of dimensions 1, 2, and 3. Throughout this protracted struggle to address food insecurity, some progress has been made. The number of persons who were undernourished in emerging countries decreased dramatically between 1990 and 2015, from 23.3% down to 12.9% (Adkins 2018).

## Overview of Food Insecurity in the USA

Similar to other nations where progress in reducing food insecurity has been hindered by factors in the natural environment, political landscape, and social settings, the USA has also experienced such impediments (Adkins 2018). Too often the focus on the developing nature of countries experiencing food insecurity overshadows the fact that the highly, post-industrialized nation of the USA also experiences a significant level of food insecurity. In 2018, data revealed that over 37 million citizens lived in food insecure households in the USA (USDA ERS Food-Insecure Households 2018).

Addressing food insecurity in the USA began as a major policy response to the Great Depression in the 1930s. This economic disaster resulted in millions of citizens experiencing hunger due to the lack of funds for purchasing food, excess farm products, and negative sales for local grocers and supermarkets. Under the presidency of Franklin D. Roosevelt, the First Food Stamp Program was implemented to address the three-pronged food access problems driving food insecurity. Its modern-day counterpart is SNAP (Supplemental Nutrition Assistance Program) that uses an electronic debit card (USDA FNS) (n.d.). Despite SNAP, national intermediary food banks such as Feed America, and a decentralized, network of local food banks and pantries sponsored by faith-based organizations and nonprofits, food insecurity remains a critical challenge for millions of citizens.

## Community Mapping to Address Food Insecurity

Policy-making to address food security is linked to community mapping with origins in the centuries-old use of cartography and geography for political purposes and social policy. With the rise of computer technology in modern times, there has been a marked increase in using maps at the community level to develop policies for solving local problems. Specifically, geographic information systems (GIS) are employed to create community maps to explore issues such as health, education, crime, and economics. Thus, governments, nonprofits, and communities have the ability to more readily employ community mapping aimed at decreasing food insecurity.

The process for community mapping generally involves community members or stakeholders in a local, geographic area identifying various assets within identified boundaries and creating physical or computer-generated visual maps of the assets (Parker 2006). This process may also include enlisting services from third parties who have

the technology infrastructure and services for data collection, analysis, and presentation. Additionally, the process may involve using community-level data that have been independently collected by third parties. The community mappings resulting from these approaches range from simple, paper-based ones to sophisticated visual and interactive mappings of community assets. Further, the computer-generated maps may be made available on websites that feature interactive features for users to locate information. Decision-making and policy development are the ultimate goals of these local mappings for residents and government officials.

The utility of employing community mapping to address local or community-driven issues is that it provides key data and information at the closest level of analysis. This drill-down access to the direct areas being impacted allows for more precise policymaking and greater success for program development and implementation. Additionally, the opportunity for citizen engagement and empowerment is also shown to be purposeful in community mapping (Parker 2006). According to Pine and de Souza (2013), empowerment and inclusion of citizens are particularly essential when addressing food insecurity. These issues are important when considering some of the critiques of stakeholder approaches. For example, Murphy (2014) expressed concern that the dynamics of power relations may not be intricately examined when traditional "stakeholder" models are used. Additionally, there is concern whether the stakeholders best represent the broader community. Efforts should be made to ensure that such issues are identified and resolved.

## Technology and Data Providers for Food Insecurity Community Mapping

There were six major entities involved in the food insecurity mapping within the case descriptions presented in the next section. ESRI, Feeding America, PolicyMap, UrbanFootprint, Urban Institute, and the US Department of Agricultural Economic Research Service (USDA ERS) are organizations at the national level that span government, nonprofit, and for-profit sectors. These organizations provide some level of technology that aids community mapping related to food insecurity or provide independent collection of food security data available for use by communities. Their involvement constitutes implementing their technology enterprises, collecting data, analyzing data, and/or presenting data for decision-making and policy development.

ESRI is a global, business leader in providing GIS services (www.esri.com). It is a third-party used by several of the communities completing food security community mapping. The scope of ESRI services used by each community varied. The community mappings are made available to the public through a website/s of the respective communities.

Feeding America sponsors the Map the Meal Gap interactive community mapping at the county level to capture food insecurity data in the USA (Feeding America 2018). Feeding America is the USA's largest food relief network after the national government. The interactive feature allows for users to enter the geographic location by state, county, food bank, or district and to filter options for demographic (overall or child), location (national or state), map type (county or district), and year (2016–2018). The results are displayed in gradient green colors with the range being light green at 4–14% up to dark green at 30% or higher. Legends display additional information about poverty level program eligibility. A description is also provided on the corresponding number count for persons experiencing food insecurity, the average meal cost, and the annual food budget shortfall for the area.

PolicyMap (2020) has a community mapping on estimated food insecurity rates for 2017 at the city-level. It is one of over 50,000 indicators in its interactive data warehouse. PolicyMap is a small business, benefit corporation aimed at making geographic data more easily accessible and understandable for decision makers. The interactive features require that an indicator be used in the find box and information entered for the address, geographic location, or latitude/longitude points field. Maps are displayed containing purple

gradient coloring for five categories. The categories range from lavender at 10.1% or less through indigo at 16.1% or higher. The color gray is shown for insufficient data. A filter is available for searching the 3 years of data from 2015 to 2017. There is also a filter to search by percent or number and a filter to shade the visualization by choosing the options of county 2010 Census data, congressional district, or state.

UrbanFootprint is a business provider of cloud-based software used by planners and industries to analyze various data sets translated into mappings. Food security community mappings encompass one of the data sets developed by UrbanFootprint. The data used for communities are extrapolated from the US Department of Agriculture's Food Access Research Atlas (USDA ERS 2015). The Food Atlas data set contains information at the census level for local community indicators of socioeconomic status and food access by miles.

The Urban Institute has developed the interactive, Disrupting Food Insecurity (DFI) Map (Urban Institute 2019). The Urban Institute is a 501(c)(3), nonprofit organization that provides objective, social science research on policy issues impacting urban areas in the USA. Under its Food and Nutrition research area, it has created the DFI to present food insecurity information on communities at the county level through an interactive mapping dashboard feature. In addition to food insecurity data, it also presents information on corresponding and interacting risk factors such as physical health challenges, economic indicators, housing costs, and resiliency that are identified as some of the underlying, root cause factors for the food insecurity levels. The main feature of this community mapping effort is its use of the "peer group." A user may search for a particular county and view which peer group the county falls into based on the county's grouping within ten levels encompassing food insecurity, the aforementioned at-risk indicators, and other background demographics including rural and urban designations. Gradient, colors from dark red to sky blue denote the ten levels.

The US Department of Agricultural Economic Research Service (USDA ERS 2015) is the main provider of policy research data on food security through its Food Access Security Atlas. The Atlas is interactive. Users type in a place and the color-coded mapping will yield information on four categories or layers: (Green) – Low Income and Low Access within 1 mile (urban) and 10 miles (rural) from a grocery story; (Orange) – Low Income and Low Access within 1/2 mile (urban) and 10 miles (rural) from a grocery story; (Red) – Low Income and Low Access within 1 mile (urban) and 20 miles (rural) from a grocery story; and (Yellow) – Low Income and Low Access using vehicle access to a grocery story. There are data available for 2010 and 2015. The mapping is generated by ESRI technology.

## Community Mapping Case Studies

This section details nine urban cities within eight states that use community mapping to address food insecurity complexities. The cities are Fresno, California; Albany and Atlanta, Georgia; Boston, Massachusetts; St. Louis, Missouri; Philadelphia, Pennsylvania; Providence, Rhode Island; Memphis, Tennessee; and Milwaukee, Wisconsin. For this research, the methodology is delimited to basic descriptions of the existing literature on the communities' food security mapping process. The grouping of case presentations by the participation of stakeholders in the community mapping process is used for classification purposes only. The classifications are Combined Stakeholder Participation ($n = 2$) encompassing citizens, community groups, and local government officials involved in the community mapping and Local Government Stakeholder Participation wherein only government officials are involved in the process of community mapping ($n = 7$). These instances of food insecurity mapping for communities also involves the third-party technology or data source providers.

### Combined Stakeholder Participation

The two cities with the classification of Combined Stakeholder Participation include Albany, Georgia and Philadelphia, Pennsylvania. For Albany, the stakeholders are the City of Albany,

institutions of higher education, and an array of community organizations, along with support from the GIS technology enterprise, ESRI. Philadelphia has three different examples of community mapping constituting the Combined Stakeholder Participation approach of community mapping. The first model features the Anti-Hunger Subcommittee of the Philadelphia Food Policy Advisory Council, which is comprised of citizens and local government officials and its transfer of the food security mappings to Key Medium, a for-profit that uses its corporate philanthropy arm to maintain it along with community support from SHARE, a local food bank. The second model involves a Feeding America network member, Philabundance, participating in food insecurity community mapping. And, a third model consists of community mapping for food insecurity conducted by the Children's Hospital of Philadelphia PolicyLab.

Albany, Georgia, is the central city for the Albany metropolitan area. Population estimates for 2019 indicated there were 72,130 residents (US Census 2020). Data in 2017 indicated that the food insecurity rate for Albany was approximately 16.1% or higher (PolicyMap 2020). In February, 2020, a Food Security Initiative was begun to help address the growing food insecurity levels resulting from closure of grocery stores in neighborhoods experiencing low to moderate income levels. Increasing food security and food access are two of the goals. The Initiative involves the partnership of the City of Albany, Albany State University (ASU), the Georgia Institute of Technology and support from ESRI, along with stakeholder groups including A Better Way Grocers, Feed the Valley Food Bank, Flint River Fresh, Southwest Georgia Project, Southwest Georgia Rising, and the USDA. Citizens, organization members and officials, and ASU students participated in the community mapping process that collected data in February and June 2020 (City of Albany, Georgia 2020).

Collected data were used to develop visualizations that are located within story maps featuring food access, food security, and health outcomes information. These story maps are in the Food Security Initiative section on the City of Albany's GeoHub. The GeoHub serves as a portal point for viewing open data sets, increasing citizen awareness and engagement, monitoring maps, and viewing data dashboards. The ESRI generated mappings contain colored location points, gradient color, and heat maps to display various food access and food security data. The food access data set includes information on the availability and quality of fresh fruits and vegetables, the availability of meat, and the spatial location of food store access by drivability and walkability measures. The food insecurity data set encompasses information from existing data on county-level health rankings for the State of Georgia.

Philadelphia, Pennsylvania, is the capital city of the Philadelphia metropolitan area. It is also the most populous city in the state. Population estimates for 2019 showed approximately 1,584,064 persons in Philadelphia (US Census 2020). Data for 2015–2017 indicated that 1 in 5 residents, approximately 18.3%, (302,685) of the citizens experienced food insecurity (Hunger Free America 2018). Community mapping under the Combined Stakeholder Participation classification is applied in three different manners for Philadelphia. The first instance involves the collaboration between citizens, local government, a for-profit, and a nonprofit to address food insecurity using community mapping. The Anti-Hunger Subcommittee of the Philadelphia Food Policy Advisory Council was the guiding force between 2014 and 2018 in the initial development of the food resources toolkit that includes the Philly Food Finder interactive map (Philly Food Finder 2020). The Council is comprised of citizens and local government officials working in collaboration to achieve a stronger food system that is equitable in meeting the food access needs of citizens. Thereafter, the for-profit company, Key Medium, which specializes in website design, assumed the management of the site under its Coding for Causes program. Additionally, the SHARE Food Program, a local food bank, assisted as well.

The interactive map displays color coded points within the City Council districts. Users input the address of the locally desired food resource. There is a custom filter available and there are standard

filters to search for results in six categories that include farmers markets, food pantries, senior meals, SHARE host sites, soup kitchens, and WIC (Women, Infant, and Children) sites. Filters are available to search by requirements for photo ID, social security card, proof of address, and referral. Filters are also included to search for benefits accepted including SNAP (Supplemental Nutrition Assistance Program), FMNP (Farmers Market Nutrition Program), and Philly Food Bucks (i.e., a SNAP incentive to purchase more fresh fruits and vegetables). Further, there is a filter for public transit accessibility. ESRI technology was used to create the mapping.

The second community mapping process to address food insecurity in Philadelphia is one initiated by the nonprofit, Philabundance, a member of the Feeding America, nationwide network of food banks (Philabundance 2020). Philabundance collaborates with 350 social service agencies in providing food resources to the local residents. The interactive map requires the user to input the address and desired distance. The results yield colored points on the street-level map identifying the location of the social services agencies. A corresponding directory is shown with the numbered results of the agencies. The information includes name, address, distance, and an option for directions. The mappings are generated by Google Maps.

The third instance of community mapping for the City of Philadelphia is through the Children's Hospital of Philadelphia PolicyLab. The hospital is a non-profit that developed its policy arm through the PolicyLab. The food security mapping was initiated to improve the health outcomes for the children and youth they served and their families. The agency used available mapping tools and developed the color-gradient maps using clinical screening data and publicly accessible information from the Food Access Research Atlas of the USDA ERS (PolicyLab 2019).

### Local Government Stakeholder Participation

The remaining seven cases for cities are those with the Local Government Stakeholder Participation classification of community mapping. Boston, Massachusetts and Milwaukee, Wisconsin have individual forms of community mapping. In contrast, St. Louis, Missouri; Providence, Rhode Island; Atlanta, Georgia; Fresno, California; and Memphis, Tennessee are all cities using the same form of community mapping.

Boston, Massachusetts, is the central city for the Boston metropolitan area and largest city in the state. Population estimates for 2019 revealed 692,600 residents (US Census 2020). As of 2016, the food insecurity rate for Boston was 18% with neighborhood rates ranging from 8.7% to 27.1% (Mayor' Office 2019). To address its food insecurity challenge, The Mayor's Office of Food Access (OFA) for the City of Boston, was created. The Office commissioned a food assessment that used community mapping to provide color-gradient visualizations for access to food stores and multiple socioeconomic and personal characteristics of residents. Additional maps were developed showing location points for food resources, youth meal sites, and farmer markets. Mappings were ESRI created.

Milwaukee, Wisconsin, is the largest populated city in the state, and it is the central city of the Milwaukee metropolitan area. Population estimates for 2019 showed there were 590,157 citizens in Milwaukee (US Census 2020). This urban location has experienced a significant degree of food insecurity in recent years. The Milwaukee Department of City Development initiated the development of community maps in 2013 to establish the baseline for food access to address this social challenge (Sachs 2017). A 3-map series was developed by ESRI to show the prevalence of food deserts and related socioeconomic factors of median household income and racial diversity (ESRI 2013). In 2017, comparison community maps were created. The analyses revealed that there was some increase in food access. Yet in 2019, a report revealed that at least 21% of residents still lived in areas considered food deserts (Hess 2019).

There are five cities employing the use of community mapping by UrbanFootprint to address issues of food insecurity. These cities are St. Louis, Missouri; Providence, Rhode Island; Atlanta, Georgia; Fresno, California, and

Memphis, Tennessee. Data indicated that the food insecurity rate for these cities is as follows: St. Louis, 16.1% or higher; Providence, 12.1–13.6%, Atlanta, 16.1% or higher; Fresno, 13.7–16.0%; and Memphis, 16.1% or higher (Bhargava 2019). The 2019 population estimates for these urban areas are as follows: St. Louis, 300,576; Providence, 179,883, Atlanta, 506,811; Fresno, 531,576; and Memphis, 651,073 (US Census 2020). The mappings consist of various gradient colors that represent the percentage of residents experiencing low income and who live beyond a half mile from the nearest grocery store (UrbanFootprint 2019).

## Conclusion

The phenomenon of urbanization presents challenges for citizens and government officials in these areas such as food security. Food insecurity continues as a serious trial for both the global community and the USA within the milieu of rising environmental, political, and social ills. For instance, the COVID-19 Pandemic has had serious consequences for already food insecure urban and rural areas globally. Fortunately, government, nongovernmental organizations/nonprofits, business communities, and citizens are aided through geographical information system technologies to map assets at the community level to make better decisions and quicker decisions when it comes to such critical issues of food insecurity and others facing urban areas. A local community's response to address food insecurity is critical because available and healthy food supplies impact the overall developmental health and quality of life of a community, especially for children and youth.

This entry describes the instances of nine urban cities in the USA employing GIS services and other GIS-generated data to accomplish community mapping to address food insecurity. The cities of Fresno, Albany, Atlanta, Boston, St. Louis, Philadelphia, Providence, Memphis, and Milwaukee conducted varying community mapping processes classified as either the Combined Stakeholder Participation approach or the Local Government Stakeholder Participation approach. The prominent entities providing the GIS technology or data for the food security mappings were ESRI, Feeding America, PolicyMap, UrbanFootprint, Urban Institute, and the US Department of Agricultural Economic Research Service (USDA ERS). These cases reveal aspects about the processes that may serve to show the viability for other cities to employ community mapping to address food insecurity. The majority of the cases show that the local government is the initiator of the community mapping endeavor. Citizens and citizen groups may have been involved in the process but the involvement was not present in the existing information. The community mapping processes in the cities of Albany and Philadelphia reveal citizen and citizen group involvement with local government officials.

The food security maps as the outputs of the community mapping process provides these cities with key data points to hopefully make decisions that will improve the food security levels in their respective communities. It is most helpful that the maps are publicly available for citizens, government officials, and others to view, which can help chart future efforts for agenda setting, budget prioritization, and programming. While these case descriptions detail aspects of community mapping to address food insecurity, the limitations of using existing data result in a "surface only" snapshot. There is a need for deeper information gathering regarding the success of the community mapping efforts. Citizens and government officials in these urban areas may consider conducting analyses of their community mapping outcomes to determine the impact of the efforts to address food insecurity. It would be particularly important to identify if stakeholder concerns presented in the literature by Parker, Pine and de Souza, and Murphy were relevant to the community mapping processes undertaken. Such information will provide additional data to help these communities as they engage in sustainable efforts for addressing food insecurity. Concomitantly, that information will be of aid to other jurisdictions seeking to employ community mapping to respond to their issues of food insecurity.

## Admin Reform in Sub-Saharan Countries

Emmanuel Botlhale
Department of Political and Administrative Studies, University of Botswana, Gaborone, Botswana

### Synonyms

Betterment; Improvement; Reorganization; Reorientation; Transformation

### Definition

In a generic sense, reform is an effort to improve institutions or processes. Administrative reform is a purposeful transformatory process whose over-achieving aim is to have a public sector that conforms to the three 3Es of management: efficiency, effectiveness, and economy.

### Introduction

In modern public organizations, betterment, improvement, reorganization, reorientation, and transformation are a commonplace pursuit. These initiatives are founded on the fact that public organizations do not exist in a theoretical vacuum. They exist in a given context, and consequently, they have to respond to demands, pressures, and stimuli that emanate from both the internal and external environments. This response, encapsulated in betterment, improvement, reorganization, reorientation, and transformation initiatives, is collectively called administrative reform. Administrative reform is a reaction to a perceived problem with the aim of improving current processes. For expository purposes, the key term, *administrative reforms*, must be defined. Khan (1980: 57) states that these are "...efforts which call for or lead to changes in the bureaucratic system of a country intended to change the existing and established practices, behaviours and structures within it." Caiden (1969: 65) says that "the need for administrative reform arises from the malfunctioning of the natural processes of administrative change." Using Caiden's logic, "administrative reform is the artificial inducement of administrative transformation, against resistance" (ibid.). Three characteristics define its distinctive features: (i) moral purpose (e.g., to improve the status quo), (ii) artificial transformation, and (iii) administrative resistance (ibid.).

Administrative reform is predicated on the philosophies of movements and schools of thought such as New Public Management, New Public Service, and New Public Governance. The other influence in the post-NPM era is the whole-of-government approach. In recent years, many countries have undertaken administrative reform as a crucial step towards strengthening their economy and better management of their social development (United Nations Department of Economic and Social Affairs 1997: 3). In both developed and developing countries, the state is the driving force in administrative reform initiatives, particularly in the latter case where the administrative apparatus is yet to be modernized so that it fully comports with the three 3Es of management. In the case of most developing countries, administrative reform is externally driven by multilateral organizations such as the World Bank and European Commission. Largely, these reforms are girded in principles of New Public Management. In some developing countries, though, the process of reform is internally driven. Such an example is Botswana. After then President Ketumile Masire

(1980–1998) visited Singapore in mid-1992, he was impressed by the country's Work Improvement Teams (WITs) movement. On his return, he introduced the WITs movement and the Botswana National Productivity Centre was established in December 1993.

In light of the dire need for administrative reforms in developing countries, some multilateral organizations help in this endeavor. An example is the United Nations Programme in Public Administration and Finance. The United Nations initiative supports developing countries and countries in economic transition in their efforts to reform their public administration structures (ibid.). In a similar vein, the United Nations produces World Public Sector Reform reports which focus on various reform initiatives. For example, the second World Public Sector Reform report in 2003, titled *World Public Sector Report 2003*; *e-government at the crossroads*, focused on *e*-government as a reform initiative (see United Nations 2003). In a similar-minded fashion, regional bodies – for example, the African Union – and subregional bodies – for example, the Southern African Development Community – are concerned with administrative reform issues. At a national level, there are many and different fora that discuss administrative reform issues. Some examples are: (i) Annual Public Sector Innovation Conferences in South Africa (e.g., the 2017 Annual Public Sector Innovation Conference, in its 11th year, took place on 30 and 31 August 2017 and focused on service delivery innovation within the context of the fourth industrial revolution) and Botswana (Public Service Conventions – the 2017 Public Service Convention was held on 12 June 2017; see, e.g., Botswana Press Agency 2017).

Administrative reforms are efforts to improve institutions or processes. Among others, they create public value. Public value refers to the value created by government through services, laws regulation, and other actions (Kelly et al. 2010: 4). Public value goes to the heart of the social contract because "the legitimacy of government as a whole generally depends on how well it creates value" (ibid.). In this regard, economic theory assumes that economic units being individuals, households, firms, and governments are *homo economicus* (economic men). In this regard, governments must optimize by maximizing benefits and minimizing costs of administrative reforms. So, reforms, if correctly applied, will favorably circumstance governments to increase public value, notably, through service delivery. Failure to add value can result in service delivery protests as it often happens in South Africa (dubbed "the protest capital of the world"; e.g., see Coetzer and Terblanche 2013).

## Political Economy of Administrative Reforms

Political Economy Analysis (PEA), deriving from Political Economy, "is concerned with the interaction of political and economic processes in a society: the distribution of power and wealth between different groups and individuals, and the processes that create, sustain and transform these relationships over time" (DFID 2009: 4). It focuses on three variables: (i) actors/players, (ii) institutions, and (iii) ideas. In this regard, for one to fully understand administrative reforms, one, inescapably, needs to understand actors/players, institutions, and ideas that come to play in the space of administrative reforms. This is so because administrative reforms, like other processes, do not happen in a vacuum. Thus, they are mediated in a crucible of actors/players, institutions, and ideas. Political Economy Analysis questions such as these are important: (i) Who are the key actors/players? Are they endogenous or exogenous? (ii) What are the key administrative institutions? What are their capacities, capabilities and independence and/or autonomy? and (iii) What are the key ideas that provide the impetus for administrative reform? What are the motivators of administrative reforms? What are the centrifugal (enablers) and centripetal (dis-enablers) forces?

Thus, the application of PEA allows the observer, researcher, or similar-minded persons to go beyond the surface of administrative reforms. This is akin to peeling off layers of the proverbial onion to get to the core of the onion.

Thus, in this regard, PEA is a very powerful tool for understanding the dynamics of administrative reforms. This is so because administrative reforms, arguably, have had positive impact in some regions in the developed world, but this record has not been duplicated in the developing world, particularly in Sub-Saharan Africa. This brings to the fore the overarching question; why are administrative reforms, generally, not producing the desired fruit in the developing world, particularly in Sub-Saharan Africa? This question is pertinent in Sub-Saharan Africa in the post-global economic crisis period. Most economies are dependent on primary products, for example, mineral-led economies (e.g., Botswana) and oil-producing economies (e.g., Angola, Libya and Nigeria) and post-2008, they are experiencing subdued demand, hence, falling prices for their products. Chronic fiscal stress has become their lot, hence, the need for administrative reforms. The administrative reforms would result in a "biggest bang for the buck" and also increase the public value. As variously documented in the literature, the record from administrative reforms in Africa presents a mixed record: few successes and many failures (e.g., see Karyeija 2012). To understand why, one must go beyond the surface through PEA.

## Contextuality of Administrative Reforms

Related to PEA is the idea of contextuality; that is, the context in which administrative reforms are carried out. Contextuality is key to the success or failure of administrative reform (Khan 1991: 60). Therefore, as much as administrative reform is firmly rooted in public bureaucracies, there is a need to consider the economic, social, and political context. In view of the foregoing, Khan advises that "reform, therefore, needs to be viewed from a systemic view" (ibid.). Therefore, based on Khan's logic, it can be argued that the economic, social, and political context can either be an enabler or dis-enabler of administrative reforms. That is, it can either positively or negatively affect the success of administrative reforms. As *homo economicus*, administrative reforms implementers must maximize and minimize enablers and dis-enablers, respectively. In this regard, governments, together with multilateral agencies such as the World Bank and European Commission, must be alive to the enabling or dis-enabling propensities of the founding economic, social, and political context.

Just like PEA, paying regard to the founding economic, social, and political context will very favorably circumstance implementing governments, together with cooperating multilateral agencies such as the World Bank and European Commission, to implement administrative reforms. In a related vein, scanning the founding economic, social, and political context will necessitate a SWOT (strengths, weaknesses, opportunities, and threats) exercise. Once the SWOT exercise has been done, administrative reforms can be rolled out.

## Administrative Reforms in Sub-Saharan Countries

The legacy of colonialization is that almost all Sub-Saharan countries were underdeveloped when they attained independence, mostly in the 1960s. Thus, big public sectors were formed in order to deal with issues of underdevelopment. By the dawn of the 1980s, there was disenchantment with the performance of the state. This led to a wave of public sector reforms. Ayee (2008), one of the pre-eminent scholars on public sector reforms in Africa, has divided public sector reforms in Africa into three phases: (i) reforms of the 1980s, (ii) reforms of the mid-1990s to early 2000, and (iii) post-2000 reforms. The 1980s saw the imposition of Structural Adjustment Programmes (SAPs) by the Bretton Woods institutions, International Monetary Fund and World Bank. Thus, most administrative reforms were introduced as part of the SAPs package. Added to the SAPs were Reaganism and Thatcherism: cutback policies of the United States President Ronald Reagan and United Kingdom Prime Minister Margaret Thatcher. Overall, the record of the SAPs in terms of re-engineering African

economies and public sectors was mixed: a few successes and many failures.

The mid-1990s to early 2000 saw an explosion of public sector reforms, particularly, New Public Management (NPM), together with the emphasis on good governance (its principal proponent being the World Bank). Subsequent to NPM and post-mid-1990s to early 2000, there were other reform packages such as New Public Service, New Public Governance, and the whole-of-government approach. Finally, post the global economic crisis, whose high noon was experienced in 2009 when the global economy contracted, there are moves to reform economies and public services in Sub-Saharan Africa. This is so because most Sub-Saharan countries are faced with chronic fiscal stress. This is due to the fact that most are primary products-reliant that have been experiencing price falls since 2009.

If one periodizes administrative reform in Africa as beginning in the 1980s, it is evident that the subregion has been experimenting with reforms for nearly 40 years. After nearly 40 years of reforms in Africa, what is the record? Admittedly, this is an area that is currently the subject of continuing scholarly enquiry. Notwithstanding, there is a body of evidence, for example, Ayee (2008), Economic Commission for Africa (2013), and Karyeija (2012), which demonstrates that the record is mixed: a few successes and many failures. There are many reasons for the dismal record. For instance, Karyeija (2012: 105) argues that there are critical areas that need to be considered when discussing public sector reform (PSR) in Africa. Some are: (1) there is need to acknowledge the importance of culture and context, because at times local values contradict the content of reform efforts, (2) PSR need both political support and support from the civil society, (3) PSR take time to bear fruit, (4) incremental implementation may be better, (5) not all support for PSR is altruistic, (6) corruption still hinders reform in Africa, (7) there is a need to revisit the role of donors, (8) first things first – let us create a credible public sector before we reform it, and (9) ownership of reform programs by African governments and other stakeholders is necessary.

## Enhancing Administrative Reforms in Sub-Saharan Countries

Based on a review of limited literature, it can be concluded that the fruit of administrative reforms in Sub-Saharan countries is yet to be realized. It is imperative that there must be concerted efforts to ensure that administrative reforms in Sub-Saharan countries bear fruit. Among others, doing would result in an increased public value that will be in good service of the social contract whose deficit is apparent in Sub-Saharan Africa. Post-2009, primary products-reliant economies are faced with subdued demand, hence, falling prices that translate into constrained revenue envelopes. These fiscal pressures mean that there is a need to ensure the "biggest bang for the buck." Added to these are pressures from a rights-asserting and assertive citizenry. In the modern day, the public service customer is not very meek, accepting of shoddy service. He/she is rights-asserting and assertive as amply instanced by deep pockets of service delivery protests. In this regard, South Africa, dubbed in some circles as the capital of protests (e.g., see Coetzer and Terblanche 2013), offers very instructive lessons on what rights-asserting and assertive citizens can do in the face of a public sector that does not satisfactorily deliver. Therefore, given the foregoing pressures and demands, being a reduced revenue envelope post-2008 and rights-asserting and assertive citizens, there is a dire need to re-think the architecture of administrative reforms in Africa as next proposed.

*Political Economy Analysis of administrative reforms*: As previously stated, administrative reforms do not, and cannot, happen in a theoretical vacuum. Among others, they happen within a political economy that, chiefly, entails players/actors, institutions, and ideas. Given the political economy of administrative reforms, it is imperative to adopt a Political Economy Analysis (PEA) approach towards the implementation of administrative reforms in Sub-Saharan Africa. PEA will enable the implementers of administrative reforms to scratch beyond the surface of the matrix of administrative reforms. In this regard, and in reference to institutions of governance of which Obama decried in September 2009 that

"Africa doesn't need strongmen, it needs strong institutions," that "development depends upon good governance," and "that is the 'ingredient which has been missing in far too many places, for far too long'" (Sunday Times 2009), there is a need to ask whether Sub-Saharan Africa is endowed with strong institutions that have the capacity to carry out administrative reforms. If, as Obama claims, there is a deficit of strong institutions in Africa, PEA will help African governments to diagnose the cause of the deficit of strong institutions with a view to find a cure. Thus, the PEA approach will enable governments to have a 360-degree appreciation of players/actors, institutions, and ideas that populate the space of administrative reforms.

*Contextuality of reforms*: Related to PEA is the idea of contextuality, that is, the context in which administrative reforms are being carried out. As correctly pointed out by Khan (1991: 60), "contextuality is key to the success or failure of administrative reform." Therefore, African governments must pay heed to the economic, social, and political context in which administrative reforms are predicated upon. A lot of contextual questions arise in this regard. Examples are: (i) Is there a grand coalition of ideas around the necessity of administrative reforms? (ii) Is there political buy-in from the highest office for reforms? What interests are threatened by the implementation of administrative reforms? In a related vein, administrative reforms are inimical to practices such as corruption in the public service and society in general. In other words, administrative reforms cannot thrive in the face of deep-rooted and endemic corruption. It is common knowledge that with the exception of a few cases such as Botswana, Cape Verde, and Mauritius, corruption is deep-rooted and endemic in Africa (see various Transparency International reports on corruption in Africa), detracting from the fruit of administrative reform. Thus, corruption is an important contextual factor to consider.

*Capacity to implement administrative reforms*: Largely due to a lack of application of professional project management techniques in many Sub-Saharan African countries, implementation is problematic. Needless to say, implementation is key to the success of any and every endeavor. Successful implementation ensures that intentions are brought to fruition. Given the fact that often, indeed almost always, projects and programs are not delivered as per the Project Management Triple Constraint of cost, time, and scope, or not implemented at all, there is no reason to expect that administrative reforms do not suffer from the same malaise. Therefore, there is a need to improve on the architecture of public sector implementation in Africa so that administrative reforms are successfully implemented.

*Monitoring & Evaluation* (M & E) *of administrative reforms*: M & E are critical to project and program success. On the one hand, monitoring allows the implementer to check if he/she is on track in terms of project objectives and goals. On the other, evaluation enables the implementer to answer questions such as what happened? what went right and wrong? and what lessons can be carried forward? It is common knowledge that most projects and programs in Sub-Saharan African countries fail due to a lack of a robust M & E framework. In this regard, given weak M & E frameworks in many Sub-Saharan African countries, it is very imperative to develop a results-based M & E framework to monitor and evaluate administrative reforms. Very vitally, the M & E framework must have indicators to ensure effective M & E of administrative reforms.

*Nonstate actors*: While the state is the chief implementer of administrative reforms, the role played by nonstate actors in this enterprise is very important. This is so because nonstate actors are critical stakeholders without whose participation and support, projects, and programs (including administrative reforms) will fail. In many Sub-Saharan African countries, there is an adversarial relationship between the state and nonstate actors. At times, the former, without adducing evidence, accuses the latter of pursuing insurrectionary foreign (read western) agendas, inclusive of illegal regime change. As a result, nonstate actors are not afforded sufficient space, if not zero space, to participate in public life. Therefore, there is a need for a paradigm shift regarding state and nonstate actors relationships.

*Strengthening parliament to oversee the executive*: In many Sub-Saharan African countries (Botswana being an example), the principle of primus inter pares (first among equals) is more honored in the breach than the observance. Thus, parliament is very weak, subservient, and subject to the whims and caprices of the executive arm of the government. In the end, it fails to exact accountability for performance (being results and no results) from the executive arm of the government. Therefore, there is an imperative need to strengthen parliament to enable it to oversee the executive, including accountability for the delivery (or none thereof) of administrative reforms. Furthermore, there is a need to create a select parliamentary committee to receive implementation reports on administrative reforms. Relatedly, there is a need to move beyond a practice where parliamentary committees, save the Public Accounts Committee, are talk shops whose recommendations the executive arm of the government can choose to ignore. Thus, the law, inclusive of parliamentary standing orders, must be amended to compel the government to act on recommendations of parliamentary committees.

## Conclusion

The state plays a very pivotal role in social and economic development in the developing world. For the state to capably discharge its social and economic obligations to the citizenry, hence, deliver on the social contract, it must be able and capable. To build ability and capability, the state must continually renew and reinvent itself through many variants of reforms, for example, administrative reforms. The overarching aim of administrative reforms is to improve the performance of the state bureaucracy. Betterment, improvement, reorganization, reorientation, and transformation, which are commonplace phrases in the lexicon of reforms, go to the heart of administrative reforms. Since the 1980s, Sub-Saharan African countries have introduced a raft of administrative reforms to, among others, increase public value and better deliver on the social contract. As much as there is dearth of empirical studies on the efficacy of administrative reforms in Sub-Saharan African countries, few available works point out to a mixed record: a few success and many failures. The causes of failures are varied. Notably, many causative factors can be blamed on the implementers, for example, lack of capable administrative institutions to carry out administrative reforms, deep-rooted and endemic corruption, and lackadaisical political support for administrative reforms from the first offices. Given the importance of reforming administrative systems in Sub-Saharan African countries, particularly post-2009, there is an imperative need to reconfigure the architecture of administrative reforms. Among others, political economy analysis and contextuality of administrative reforms are key. Beyond the foregoing two factors, there are key policy issues that reformers in Sub-Saharan Africa must consider. Examples are: building implementation capacity, establishing results-based monitoring and evaluation frameworks, cultivating cordial state and nonstate relationships to enable the latter to exercise oversight on the executive arm of the government and, finally, strengthening parliament to exact accountability for results, inclusive of implementation of administrative reforms, from the executive. Finally, doing so will ensure value for money from reforms.

## Synonyms

Administrative evil; Environmental injustice; Flint; Technical rationality

## Definition

The Flint Water Crisis persisted despite residents' protestations, and the crisis can be viewed through the lens of technical rationality across all levels of government (i.e., local, state, and federal). Technical rationality explains that the crisis was due to excessive reliance on professionals, neutral objectivity, and contextual indifference. These three factors combined to create an egregious example of environmental injustice in Flint, Michigan.

## Introduction

The systemic flaws within all levels of government paved the way for the Flint Water Crisis. Both Flint and Detroit are marked by a history of population shrinkage and white flight (Benz 2019). Once a thriving American industrial community, Flint experienced significant population loss. At its greatest in the 1960s, Flint's population was close to 200, 000 people (Hammer 2019). The GM layoffs decreased middle-class homeownership while Flint was still struggling to replace the lost population (Sadler and Lafreniere 2017). The outcome was a significant loss in population and the deindustrialization of Flint. An impoverished, minority community was left in its wake while Genesee County remained both whiter and wealthier than the city of Flint (Hammer 2019). These early changes to the population of Flint lay the foundation for what would eventually become one of the worst environmental injustices in America.

## The Birth of a Crisis: Flint Decision-Makers

Flint has been a concern for several decades due to its declining population and a high percentage of citizens living below the poverty line (Davis et al. 2016). Possibly correlating its high poverty rate, Flint's crime rate has soared, and the city is ranked one of the lowest in quality of line and other health concerns. Over a few years, the spotlight in Flint has been the issue of the Flint water system, the topic now referred to as the Flint Water Crisis. In 1967, Flint signed on with the Detroit Water and Sewerage Department (DWSD) to maintain its water supply. The Flint Water Treatment Plant (WTP) had been used before 1967 for their water treatment, and after 1967 was used as an emergency backup to the DWSD. Flint signed a

35-year contract with DWSD and renewed it annually after that. During the last 10 years, the DWSD increased prices at about 6.2 percent a year (Davis et al. 2016). In April 2013, the Flint City Council voted to join the Karegnondi Water Authority (KWA), which prompted the DWSD to withdraw their renewal with Flint.

### The Flint Water Crisis

A year later, on April 25, 2014, the DWSD stopped supplying water to Flint, and so the Flint water system began to operate under the WTP as before 1967. The Environmental Protection Agency (EPA) requires that water be treated for corrosion control. Due to purported confusion surrounding the federal regulations related to population size, the Michigan Department of Environmental Quality (MDEQ) determined that this was unnecessary and so the WTP began to distribute the water to Flint citizens. Within 6 months, *E. coli* had been discovered in the water and the incidence of Legionellosis had increased. In August and September of that year, a boil advisory was issued. By October, General Motors had taken steps to switch to a different water source after chemicals in the Flint water were rusting and corroding their materials. The city began warning residents of the presence of harmful chemicals within the water in January 2015. However, following the many reported issues related to the Flint Water, the city's emergency manager, appointed by Governor Snyder, refused an offer from the DWSD to switch the water source back to Lake Huron (Anderson 2017). Over this time, there had been many cases of high levels of lead reported, and Virginia Tech stepped in to study the lead issue. In October 2015, Flint finally switched back to the DWSD for their water supply (Davis et al. 2016).

## The Impact of the Flint Water Crisis

The consequences of the FWC are far-reaching: citizen mental and physical health; Flint's financial well-being; decreased community engagement; and impaired trust in the government (Inwood 2017; Sherwin 2017). When the water source was switched to WTP, complications arose from lead and bacteria leaching into Flint drinking water, and residents complained of brown water and several physical ailments, including hair loss and rashes (Anderson 2017; Sherwin 2017). After the water toxicity was realized by the government and General Motors, the danger was concealed from the public (Dettloff and Bernico 2017). Attempts at minimizing the issue extended as far as discrediting an EPA official who alerted citizens to the contamination (Anderson 2017; Sherwin 2017). Only after university staff began independent testing did the media begin to inform the public about the contaminated water (Chavez et al. 2017).

Unfortunately, by this time, numerous children were already suffering from elevated lead levels and a severe outbreak of Legionnaires' disease had left several citizens dead (Berliner 2017; Inwood 2017; Sherwin 2017). Although the lead poisoning and Legionnaires' disease are widely publicized (Anderson 2017; Dettloff and Bernico 2017), the less-discussed factors of the switch have also caused considerable harm. For example, studies have found that Flint residents display symptoms of post-traumatic stress disorder (Kruger et al. 2017) and increased rates of depression and anxiety postcrisis (Cuthbertson et al. 2016). Although steps have been taken to resolve the crisis, the impact of the contaminated water continues to harm Flint (Dettloff and Bernico 2017).

## Administrative Roles in the Flint Water Crisis

The multilevel nature of the FWC from onset to the present, as well as accountability for the crisis, spreads across federal, state, and local government, as is indicated by its legal implications. Sherwin (2017) identified the role that government levels played in the FWC through an analysis of local, state, and federal manipulations of the Lead and Copper Rule. Berliner (2017) further supported the multilevel role of government with a critique of federal and state lawsuits against the professionals who facilitated the water changes. Several other authors place culpability on the

negligent acts of officials during the crisis (Anderson 2017; Chavez et al. 2017). Inwood (2017) emphasized the indifference of state and federal officials concerning funding assistance during the FWC's initial stages. Yet perhaps the clearest example of the interplay between these three levels is the appointment of an emergency manager by state officials.

## PA 436 of 2012 and Emergency Management Laws

PA 436 OF 2012 is a law passed by the Michigan Legislature to appoint emergency managers during times of financial crisis in local communities. During the FWC, emergency managers were appointed to address the financial problems caused by the increasing prices of the DWSD. Emergency managers were the main actors who made the decisions that harmed Flint. Emergency managers affected the decisions in Flint: Ed Kurtz decided to switch from DWSD to WTP, Darnell Earley allowed the switchover to WTP, and Jerry Ambrose and Darnell Earley decided that switching back to DWSD would be too costly despite the harm WTP was causing citizens (Davis et al. 2016). The primary issue was lack of accountability as the emergency managers were not elected officials.

## The Undemocratic Nature of Emergency Management

Although emergency managers were authorized under PA 436, it is necessary to reassess their role in government decisions. The law allowed them to take over the functions of the governing body and make decisions that they found essential to save cities from the financial crisis, with no connection to constituents as state-appointed, nonelected officials. Their focus is quickly shifted to the financial crisis instead of citizen needs, fractioning decisions based solely on technical needs. In Anderson's (2017) evaluation of Michigan's emergency management laws, she argued that they remove power from local politicians and residents by placing decision-making exclusively in the hands of the emergency manager. Citizen-elected delegates are replaced with disconnected emergency managers while the already struggling city is forced to take on the additional costs of an unelected public official.

Several scholars have argued that the federal, state, and local governments are responsible for causing and resolving Flint's suffering (Anderson 2017). The presence of such a large-scale and significant crisis known by federal, state, and local officials indicates that systemic flaws created it and contributed to its survival. Only through systemic-level weaknesses could a crisis continue to prevail as it was brought to the attention of increasingly powerful levels of government.

## Technical Rationality and Administrative Evil in Flint Case

Technical rationality is a thought process that values the scientific process and professionalism to the detriment of ethical behavior (Adams and Balfour 2014, pp. 28). The scientific method that technical rationality favors is marked by neutral objectivity and professional specialization. Both undermine ethical considerations through rigid standards that fail to take situational context into account (Adams and Balfour 2014, pp. 29–32). Typically, those involved believe they are fulfilling their administrative role without considering the harm caused by their decisions. A hallmark of technical rationality and modern professionalism is that experts are given nearly unlimited influence over their field and often remain unquestioned throughout decision-making processes (Adams and Balfour 2014, pp. 30–33). A prime example of the devastating impact of technical rationality and the focus of this entry is the Flint Water Crisis (FWC). The FWC is an example of modern administrative evil and the abysmal failure of government at all levels. Technical rationality in Flint occurred through an excessive trust in professional specialists, the neutral objectivity of administrators, and contextual indifference to Flint's lead risk factors in favor of widespread budget-cutting. Neutral and detached decision-

making was the result of disastrous consequences. The most dramatic example of technical rationality within the Flint Crisis was through the application of emergency management laws.

A hallmark of technical rationality and modern professionalism is that experts are given nearly unlimited influence over their field and often remain unquestioned throughout the decision-making processes (Adams and Balfour 2014, pp. 30–33).

## Conclusion

The harm of technical rationality, as it relates to various social issues, has been highlighted in past literature (Adams and Balfour 2014, pp. 108). Technical rationality and modern professionalism are ineffective at forming public policy as social issues are too complex for such a simplified approach (Adams and Balfour 2014, pp. 107–108). Further, such an approach often not only fails to protect citizens but can also cause excess harm to those who are already vulnerable. Despite this, signs that technical rationality is currently applied to contemporary social issues are prevalent. The evidence of widespread neglect, indifference, and application of technical rationality in the case of water poisoning in Flint is overwhelming and requires an evaluation of the current understanding of the governmental role in traumatizing communities in a democratic society.

# Administration and Discretion

Benson Matipa
Mwense District Administration, Mwense, Luapula, Zambia

## Synonyms

Management; Choice; Department and misuse of authority

## Definitions

1. **Administration**
   It entails the responsibility of running or controlling a business, company, or organization.
2. **Discretion**
   It means the freedom to decide what should be done in a particular situation. It also entails the power or right to decide or act according to one's own judgment.
3. **Administrative agencies**
   It means an official governmental body empowered with the authority to direct and supervise the implementation of particular legislative acts.
4. **Abuse of discretion**
   It entails a failure to take into proper consideration the facts and law relating to a particular matter.

## Introduction

Discretion in public administration is a necessary part of government in the modern world due to government's various roles and activities undertaken daily. The idea of administrative discretion dates back as far as the time of Socrates, the Greek philosopher. Thus, administrative discretion is beneficial because it gives individuals with authority the opportunity to make quick decisions in situations where they are necessary and it also gives power to those who have the wisdom and experience to make important decisions. Administrative discretion allows agencies to use professional expertise and sound judgment when making decisions or performing official duties, as opposed to only adhering to strict regulations. Thus, an administrator has administrative discretion when he or she has the freedom to make a choice among potential courses of action.

## Administration

The word "administration" is derived from the Middle English word *administracioun*, which in turn is derived from the French *administration*, itself derived from the Latin *administratio* a compounding of *ad* ("to") and *ministratio* ("give service"). Administration refers to the universal process of organizing people and other resources efficiently so as to direct activities toward achieving common goals and objectives (Simon et al. 1950). It includes creating rules and regulations, making decisions, management of operations, and creating organization of employees to direct activities toward achieving an organizational goal. Administrators should ensure that the principles of management which include hierarchy, control, unity of command, delegation of authority, specialization, objectives, centralization, and decentralization are adhered to. Modern business management theory identifies six key functions of an administrator in an organization, namely, planning, organizing, staffing, directing, controlling, and budgeting.

## Discretion

Discretion entails the power to make a decision that cannot be determined to be right or wrong in any objective way. For instance, a university that interviews prospective students has the power to admit some applicants and reject some; an executive may choose a secretary out of a field of applicants; the sovereign may pardon some convicts and not others. While one could disagree with any of these decisions, there is no body or person entitled to correct them and declare them wrong (Grey 1979). Those in positions of power are most often able to exercise discretion as to how they will apply or exercise that power. As opposed to judgment, discretion is usually to be applied where it is expressly left to the functionary to make a determination at any point within a given range.

## Administration and Discretion

In modern management the demand for more issues to address and a greater number of actors

to address them mean that choice is ever more important in administrative roles. The administrators are therefore required to extensively exercise discretion to address the issues they face. In administration, discretion involves a right to choose between more than one possible course of action upon which there is room for reasonable people to hold differing opinions as to which is to be preferred (Grey 1979). It entails the usage of a public officer's own judgment or intuition to make decisions, especially where the rules, regulations, and procedures appear gray or such usage becomes imperative due to a context-dependent situation (Molander and Grimen 2010). For instance, discretionary powers become activated where the effective limits on the public officer's power and authority leave him or her free to make a choice among possible courses of action or inaction (Davis 1969). It is argued that when the constitution, laws, regulations, and standard operating procedures do not succinctly express a course of action or inaction (whenever there appears to be gray areas), administrators are then left with the freedom to make decisions among many options they deem fit ideally based on their best judgment.

Those in a position of power are most often able to exercise discretion as to how they will apply or exercise that power. Thus, discretion enables them (those in a position of power) ability to make decisions which represent a responsible choice and for which an understanding of what is lawful, right or wise could be arrived at. For instance, police officers use discretion to simplify their very complex job requirements and also to identify certain individual priorities. Each officer has to apply the very broad and often contradictory laws put into place by statutes and policy-makers. If officers had to cite or make an arrest on every law being broken, the world would need a police officer for every two to three citizens. Therefore, we have to leave it up to the individual officer to use discretion in cases where a gray area resides, because not every offense should be booked. This is one of many situations where discretion comes into play. There are other things that contribute to the individual officer's use of their discretion. For example, the sex or minority status of an officer would often lead them to act in different ways and use discretion in different ways than that of the opposite. Secondly, where an officer was raised or what they have experienced would lead them to react to situations differently.

Today what discretion has been converted to is just simple favoritism of the ugliest appearance. Discretion has been so shamelessly used that it has lost its real meaning. Just because rules and laws cannot be made for all possible eventualities, the use of discretion was given to people in high places and to people who matter. In old days, discretion was meant to be used with caution and sparingly only where and when necessary. It was also meant to be used for the furthering of a task. However, with the passage of time, this discretion has come to be used as a tool for advancing personal interests rather than tasks at hand. In this way, the discretion meant to be a blessing for people to see work move smoothly has become a curse to activities of human existence. This is because, just as man misuses all his other rights, he is found misusing this right of using discretion also. The idea of giving this discretion was originally to help him utilize whatever is available to him for the best use for work. However, it is mostly seen that it is conveniently converted to favoritism. With an eye on future gratification, discretion is used to serve personal advantages rather than the advantage of work.

Favors are given not to the most deserving or to those who need the favors to work more efficiently, but to those from whom advantages may be reaped at a later date. Human nature is so weak, greedy, and selfish to the extent that rosy ideas of the like of discretion become more of liabilities than assets. Either the wrong people reap advantages or the authority takes advantage, and it all becomes a genuine deception. Thus, the use of discretion in an organization demands for highly disciplined, selfless, and goal-focused administrators to apply it genuinely. Otherwise without these qualities, the concept of discretion in administration is just a curse.

## Types of Administrative Discretion

In a bureaucratic system, discretion could be classified into two, namely, de facto and de jure. De facto discretion entails that officials derive their discretion by taking advantage of some form of vagueness or ambiguity in the letters of procedures, the rules or the regulations, and inadequate checks and controls on the public official. On the other hand, de jure involves some kind of formal approval to use such discretionary powers where feasible, for example, to ascertain a social right or assess needs (Hvinden 1994). This kind of discretion has its conferment done by policy-makers or legal documents relative to standards set by the same authority. For instance, Ghana's Petroleum (Exploration and Production) Act 2016 has a provision that gives the sector Minister the power to discard competitive bidding results and to use his discretionary powers in the award of oil block contracts to an entity he deems fit.

## Administrative Agencies and Discretion

Generally, administrative agencies are given broad discretion to exercise their administrative authority. This is because administrative agencies' duties necessarily include the right to exercise discretion. Reason for granting discretionary power to administrative agencies is because they possess experience and specialization in a particular area. These experience and specialization help agencies in making decisions in the agencies' area of expertise.

An administrative agency enjoys wide discretion in ascertaining best way to handle related, yet discrete issues in terms of procedures and priorities. Administrative agencies exercise wide discretion in selecting the methods to attain the legislature's goals. Administrative agencies can adopt rules and policies to carry out duties delegated by legislature. The rules and policies should be consistent with statutory provisions. This discretion is allowed to administrative agencies to adapt their rules and policies to the demands of changing circumstances. Administrative agencies' discretionary power extends to deciding remedies for infringement of agency policies. Administrative agencies have specialized knowledge and power to achieve legislature's objectives. Hence, the agencies have discretion to develop appropriate enforcement policy to attain statutory obligations. Administrative agencies can also decide on appropriation of funds available, efficiently and economically to accomplish its policies.

Discretionary powers exercised by administrative and legal authorities are permissive and not binding. These powers are granted to these officials by statute or delegation. Discretionary powers do not impose an obligation on a decision-maker to exercise them or to exercise them in a particular manner. Thus, administrative agencies must exercise discretionary powers in accordance to legal requirements. Discretionary power must be used reasonably, impartially, and avoiding oppression or unnecessary injury.

Administrative agencies are provided with discretionary power to ascertain place and time to hear and decide matters that come before it. Agencies have the power to prosecute or enforce matters through civil or criminal process. For instance, administrative law judges have discretion to abstain from participating in a legal proceeding due to a conflict of interest of the adjudicator. In addition to that, an adjudicator has power to decide whether or not to impose a sanction.

## Abuse of Discretion

An abuse of discretion is a failure to take into proper consideration the facts and law relating to a particular matter, an arbitrary or unreasonable departure from precedent and settled judicial custom. Abuse of the discretionary power can be alleged only to reverse a decision and not to allow it. On the other hand, failure to exercise reasonable judgment or discretion is also termed as abuse of discretion. It is therefore imperative for administrative law to be applicable in any organization; otherwise public interest could be at risk if various agencies were not following laws and regulations.

## Conclusion

Although administrators are faced with challenging situations in their day-to-day decision-making, they are seen in society as moral agents with the task to exercise discretion so as to reflect the society's values. Hence, the public expects administrators to be the exemplary role models of society and follow laws and regulations in their day-to-day decision-making. Administrators therefore must use discretion at one point or the other as they are bound to uphold the highest standards of accountability and responsiveness. Nevertheless, administrators should first figure out whether or not they have discretion in the first instance before applying it. It is indisputable that discretion is required in administrative processes, although the challenge lies in ascertaining ways to confine and structure discretion in order to prevent violation of the rights of citizens. It is thus imperative that administrators exercise discretion in public interest and in recognition of the importance of representative bureaucratic norms.

# Administrative Adjudications

Gardenia Harris
Illinois State University, Normal, IL, USA

## Synonyms

Adjudicatory proceedings

## Definition

Administrative adjudication refers to federal and state administrative agencies' use of judicial powers granted to them by the legislative branch. Administrative adjudication includes a wide variety of agency activities, except for rulemaking, ranging from routine processing of tax returns to final determination of national regulatory policies. During adjudications, administrative agencies examine the facts and circumstances of individuals' or corporations' situations and then apply their policies to them (Funk and Seamon 2006). Adjudication is the application of the agency's policies to a past act to resolve disputes regarding rights and duties (West's Encyclopedia of American Law 1998). Many administrative adjudications resemble adversarial civil court trials, but other adjudications simply consist of routine administrative actions. The initial determination and reconsideration of eligibility for government benefits is an adjudication because the agency uses the individual's status and circumstances to decide if he or she qualifies for a benefit according to agency policies. Adjudication culminates in a formal disposition, known as an "administrative order" for or against the party or parties that appear (Funk and Seamon 2006).

## Introduction

The New Deal ushered in a new era of federal government characterized by increased regulation of social and economic matters. Congress

delegated much of the responsibility for implementing these regulations to the administrative agencies established for that purpose (Gellhorn and Levin 1997). Congress envisioned these agencies as apolitical bodies, run by experts who possessed the knowledge and skills needed to regulate industries effectively. However, in reality, the agencies were more political and less adept at regulation than expected. Not surprisingly, the formerly unregulated business sector balked at this government intrusion and challenged the government's right to regulate them through litigation (Funk and Seamon 2006).

The Fifth and Fourteenth Amendment due process protections guarantee that federal and state governments, and the agencies they create, cannot deprive someone of his or her life, liberty, or property without a reasonable opportunity to challenge the agency's actions. Under these protections, people have the right to receive fair warning of the limitations an administrative agency will place on their behavior (The Free Dictionary 2015). In constitutional democracies, government institutions that establish and enforce public policy are politically accountable to the electorate (Gellhorn and Levin 1997). Since agency heads and administrators are not elected, Congress established administrative courts within these agencies to make them directly accountable to the electorate, who may petition agencies directly (Nolan and Thompson 2014).

In response to the widespread complaints about the unreasonableness of administrative agencies' decisions, Congress enacted the Administrative Procedure Act (APA) (5 U.S.C.A §§ 551–706, 1946) to make agencies' procedures more fair and uniform so the public would have less reason to object to them. The APA establishes the rulemaking requirements, hearing procedures, and adjudicatory standards and procedures for federal agencies (Funk and Seamon 2006). The large number of cases where agencies were statutorily or constitutionally required to conduct a hearing required federal agency heads to delegate responsibility for conducting these hearings to subordinate hearing officers (Mullins 2004). Furthermore, the large number of formal adjudications coupled with the size of the records assembled for major contested hearings prohibits agency heads from reviewing more than a select proportion of cases (Gellhorn and Levin 1997). Based on long-standing common law principles and the judicial adversary model of decision-making, the APA structurally separated adjudication from other agency functions, including rulemaking, through the creation of an independent corps of hearing examiners (Kerwin 2003).

## Administrative Law Judges

Article III of the US Constitution establishes only one court – the Supreme Court. Article III gives Congress the power to establish the lower courts necessary to conduct federal business. Article III judges enjoy lifetime appointments and salary protection to insulate them from political pressures. To make the federal court system more workable, Congress established non-Article III courts to handle a variety of court cases that would normally fall under Article III judge's jurisdiction. The non-Article III judges who adjudicate administrative agency cases are called administrative law judges (ALJs) (Nolan and Thompson 2014).

As employees of the administrative agencies for which they hear cases, administrative law judges were subject to the direction and control of the agency and were therefore perceived as being inclined to issue decisions favorable to the agency. Considerations of fairness led to granting these hearing officers increasing degrees of independence, culminating in the provisions of the APA which accords these hearing officers unique status (Mullins 2004).

Although administrative law judges do not receive the same constitutional protections Article III judges enjoy, they are accorded some statutory protections regarding their appointment, tenure, and compensation to ensure their independence (Nolan and Thompson 2014). Administrative law judges are appointed through a professional merit system that considers applicants' scores on competitive examinations and often their experience with the administrative agency (Gellhorn and Levin 1997). To ensure their independence, their

appointment is unqualified. In addition, ALJs are exempt from most of the managerial controls that apply to other employees, including performance appraisals. In addition, their compensation is not based on agency recommendations, but is determined by an independent body, the Office of Personnel Management. Finally, the agency they adjudicate for can only discipline them for "good cause" which is established before the Merit Systems Protection Board (Mullins 2004).

## Formal and Informal Adjudications

Administrative adjudications can be formal or informal. Formal adjudications are governed by the APA. Most formal adjudications resemble judicial civil trials and employ an adversary decision-making process. They utilize adverse parties, trial-like procedures, lawyers, a judge, and a final decision based on evidence presented, complete with findings of fact and conclusions of law. There is also an opportunity for an appeal to the agency head or the full commission (Funk and Seamon 2006) and ultimately the courts.

Agency adjudications conducted outside the APA framework are called informal adjudications and are governed by special statutory procedures or the agency's own regulations and must comply with procedural due process (Funk and Seamon 2006). Often, informal adjudications resemble formal adjudications (Gellhorn and Levin 1997), but while only administrative law judges may preside over formal APA adjudications, they rarely preside over non-APA adjudications. Generally, non-APA informal adjudications are conducted by administrative judges (Funk and Seamon 2006). Administrative judges lack the same statutory protections granted to administrative law judges. To guarantee them a degree of independence, administrative judges are housed in organizations separate from the agency (Mullins 2004).

An increasing number of agencies have received statutory authority to decide individual cases through informal adjudications. The particular substantive statutes under which the informal adjudications take place often specify certain procedures. Typically, agencies adopt regulations specifying the procedures for their informal adjudications that closely follow formal adjudications. However, despite the increased use of informal adjudications, the formal adjudication process is still the preeminent model by which agencies make their most momentous decisions (Funk and Seamon 2006).

## Licensing

Licensing is a subset of administrative adjudication. Similar to the application for benefits, there are typically no adverse parties or trial-like procedures when licenses are issued. Licensing encompasses granting permission for someone to engage in a regulated activity. Examples of licensing include issuing permits for people to fill wetlands, allowing a company to operate a business on federal land, or granting a license for a civilian nuclear reactor to begin operation (Funk and Seamon 2006).

## Rules of Evidence

Administrative adjudications are governed by lenient rules for the admission of evidence and the scope of cross-examination. APA evidentiary rules allow the admission of any evidence the presiding officer deems appropriate, including questionable or challenged evidence. The APA only suggests that insignificant or redundant evidence should be rejected. Therefore, evidence that would be inadmissible in court proceedings is regularly accepted during administrative adjudications, including hearsay testimony. The APA established liberal rules for the admissibility of evidence because of the different nature of the administrative adjudication proceedings. Judicial rules of evidence are formulated with jury trials in mind and assume that jurors may overestimate the value of hearsay testimony (Gellhorn and Levin 1997). Although judicial proceedings rely heavily on the evaluation of the quality of eyewitness testimony and witness demeanor to assess the quality of evidence, witness demeanor contributes little to hearing officers' assessment of evidence. Instead, in administrative adjudications the

experts' qualifications and backgrounds that are more important in determining the soundness of the inference drawn on matters such as medical and psychological diagnoses or the likely impact of an action on the environment. It is assumed that administrative law judges with expertise on the issues are more highly qualified to evaluate the quality of evidence than typical jurors (CQ Press 2012; Gellhorn and Levin 1997). Expert decision-makers reduce the likelihood that the final decision will be based on erroneous evidence. In this context, it may be more efficient to allow expert decision-makers to assess the value of hearsay and other questionable evidence, as opposed to spending a lot of time and resources debating the admissibility of the evidence (Gellhorn and Levin 1997).

The APA also fails to provide a clear standard for the allowable scope of cross-examination during administrative adjudications. As a result, many adjudications allow almost unrestricted cross-examination of witnesses out of concern that the hearing time spent arguing over the scope of cross-examination might be greater than the time used for unrestricted cross-examination. Hearing officers also allow unrestricted cross-examination out of concern that cutting off a line of inquiry could result in an appeal or reversal of their decision (Gellhorn and Levin 1997), by agency heads or the courts.

Written evidence plays a more significant role in administrative proceedings than in court proceedings. A formal agency adjudication is supposed to be decided solely on the basis of the recorded evidence. The APA contains an "exclusiveness of the record" provision which mandates that the ALJs' decision be based solely on the transcripts of the testimony, the exhibits submitted during the hearing, and the papers and requests filed in the proceeding. Out of fairness, the litigating parties must be allowed to know the evidence that may be used against them, have the opportunity to rebut the evidence, and contest it via cross-examination. Allowing decision-makers to consider facts outside the record could nullify this right (Gellhorn and Levin 1997).

In contrast to judicial proceedings, the APA makes it clear that ALJ's decisions are not final and that agency heads are the ultimate decision-makers and are not required to accept the ALJ's fact finding or decision-making. However, the ALJ's decision carries considerable weight because they heard the testimony firsthand and devoted the most time to mastering the issues (Gellhorn and Levin 1997). Gellhorn and Leven (1997) suggest that the difference between judicial and administrative practice may be related to the importance of factual matters informing agency policy. They argue that appointed agency heads, who have the primary responsibility for formulating policy, should have some accountability to the political process and therefore should not be bound by ALJ's decisions. APA provisions support this contention.

## Formal Adjudication in the States

Administrative adjudication has become so widespread at the state and municipal level in areas such as public utilities, natural resources, banking, securities, worker's compensation, unemployment insurance, and employment discrimination, that outside of Washington, DC, most lawyers who practice administrative law primarily practice state administrative law (Goostree and Greenfield 2003). Federal administrative law, including the APA, does not apply to states or state agencies. State agencies are governed by state administrative law and each state's administrative law is unique to that state (Funk and Seamon 2006). Some states have administrative procedure acts comparable to the APA. At the state level, judicial review is usually broader than under the federal act (Goostree and Greenfield 2003). Like federal administrative law, state administrative law evolved through common law. At the state level, like the federal level, administrative adjudication covers a wide range of procedures; some state administrative adjudications look like APA adjudications, and some do not. Similar to the federal system, state adjudications apply state laws to particular facts and circumstance with respect to particular persons (Funk and Seamon 2006).

The most notable difference between administrative adjudication at the state and federal level is

the different way states responded to the issue of hearing officers' independence. Instead of employing hearing officers through the agency involved in the adjudication, many states have established central panels of administrative law judges to hear cases. Administrative law judges who are part of central panels are employed by a separate independent agency and hear cases arising in different agencies (Funk and Seamon 2006).

## Conclusion

People in the United States enjoy greater freedom than citizens of almost any other nation. Close scrutiny reveals that despite this high degree of freedom, most behaviors are regulated, at least to some extent, by law or administrative rule and regulation. Through these processes, governments place limitations on what citizens can do and often on when, where, and how they can do it. Federal and state legislatures established administrative agencies to implement and enforce laws and regulations. Administrative adjudication is the process through which agencies that wield vast amounts of power are theoretically held accountable to the public. Administrative adjudication provides a practical method for citizens to redress disputes with government while allowing government to operate in an expedient and cost-effective manner. However, this efficiency comes at a cost to the liberties the Founding Fathers considered so important.

In effect, administrative agencies have been granted powers contradictory to the US Constitution. For example, they are empowered to make momentous, far-reach judicial decisions, without the benefit of a jury. Furthermore, in contrast to civil and criminal courts, administrative courts have inquisitional power to investigate and initiate action, rather than simply hearing cases brought before them. Administrative agencies operate under looser rules of evidence and are granted the rare privilege of admitting hearsay evidence, if the presiding officer determines it is warranted. Some analysts have called for placing additional limitations on administrative agencies to more closely align them with Constitutional guarantees. Suggestions for reform include limiting administrative agencies' powers by returning them to the jurisdiction of the traditional court system and restricting them to powers and duties held by civil and criminal courts (Postell 2014).

# Administrative and Judicial Due Process

Eric T. Kasper
University of Wisconsin-Eau Claire, Eau Claire, WI, USA

## Synonyms

Fairness; Impartiality; Lawfulness

## Definition

The conduct of administrative or judicial proceedings according to recognized standards and rules in cases where rights are at stake; these rights include notice and a fair hearing.

## Introduction

Due process is an important, although at times elusive, concept in common law systems, including the United States. It has both substantive and procedural elements to it, but at its core, it is a fairness protection of the individual from arbitrary government action. More specifically, it ensures that when the government wishes to take one's life, liberty, or property, the government gives a person adequate notice of the reasons for the government's actions and a hearing, possibly a trial, for the person to challenge what the government has done or plans to do.

In addition to protecting fairness, one of the hallmarks of due process is malleability. Indeed, the concept is intentionally vague so that it may be adapted to changing times and to different sets of circumstances. For reasons that will be explored in more detail below, due process promotes fairness while avoiding rigidity. Put another way, in the words of the US Supreme Court, due process "cannot be measured in minutes and hours or dollars and cents" (*Taylor v. Hayes* 1974). In other words, due process, and its underlying concept of fairness, encompasses procedures and rights that are not always the same in every context.

The idea of due process has a rich history that dates back at least eight centuries in Anglo-American law. It applies in similar ways, with some notable exceptions and alterations, in both judicial and administrative settings.

## The Historical Development of the Concept of Due Process

The contemporary notion of due process is derived from the English Magna Carta of 1215. The original Magna Carta placed numerous limitations on the power of the English King and government generally. Article 39 of that document held that "No free man shall be taken, imprisoned, disseized, outlawed, banished, or in any way destroyed, nor will We proceed against or prosecute him, except by the lawful judgment of his peers and by the law of the land." The last few words of this article required that if the liberty or property of English subjects would be taken, then a certain set of procedures – the law of the land – would need to be followed. This concept of legal procedures being required in such cases was underdeveloped in 1215, but its placement in Magna Carta began the long progression of the right that we know today as due process (Orth 2003; Kasper 2013).

By the fourteenth century, the phrase "law of the land" had become common in English law. In the seventeenth century, its power was tested by the infamous Five Knights' Case. King Charles I arbitrarily imprisoned five knights who had failed to pay back loans to the King. However, none of these knights had been formally charged, given the opportunity for bail, or given a trial. Parliament's reaction was to pass the 1628 Petition of Right, which reaffirmed that the "law of the land" guarantee from Magna Carta was a definite right, not a privilege that the King could take away as he pleased (Kishlansky 1999).

Shortly thereafter, the right to have one's case adjudicated according to the law of the land was

finding its way into legal documents in the American colonies. The Maryland Act for the Liberties of the People of 1639 stated that no one shall be "judged or punished than according to the Laws of this province." Similarly, New York's 1691 Act Declaring Rights and Privileges proclaimed that one's life, freedom, or possessions could not be taken except by "the Laws of this Province." After independence from Great Britain was declared in 1776, each American state wrote its own constitution. No fewer than 10 of the original 13 states included requirements that legal proceedings take place according to "the law of the land" or included similar language between 1776 and 1783 (Cogan 1997). Clearly, the right was seen as paramount throughout the fledgling new nation.

During the late 1780s, the phrase "law of the land" was changed to the more modern "due process of law." This began when New York rewrote its state constitution in 1787, using the latter phrase. During the first session of the US Congress, James Madison proposed as part of the draft for the Bill of Rights that "[n]o person shall. . .be deprived of life, liberty, or property without due process of law." This provision was not altered through the amendment process, and it was ratified as part of the Fifth Amendment to the US Constitution in 1791 (Cogan 1997; Schwartz 1992).

Lest there be any doubt that the legal precursor to the requirements of "due process of law" was Magna Carta's phraseology related to "the law of the land," the US Supreme Court held as much in *Murray's Lessee v. Hoboken Land and Improvement Company* (1856), when it stated that the "words, 'due process of law' were undoubtedly intended to convey the same meaning as the words 'by the law of the land,' in Magna Charta" because if the Constitution had used the older language, it "would have been in part superfluous and inappropriate" and "without its immediate context, might possibly have given rise to doubts" about the meaning of the phrase. For these reasons, the phrase "law of the land" was replaced in American legal documents by "due process of law," including in the Fourteenth Amendment in 1868.

## Basic Procedural Requirements of Due Process

As noted above, due process, at its core, requires fairness. At the very least, this means that when the government threatens to take away or deny a right protected by due process, the government must provide a right to notice and hearing. Examples of what constitutes a "fair hearing" were outlined by the US Supreme Court in *Goldberg v. Kelly* (1970); these rights, depending on the context, typically include the following: timely and adequate notice that detail the reasons for the government action, an effective opportunity to defend oneself against the government action by confronting adverse witnesses and by presenting one's own arguments and evidence, and the right to an attorney. Within a criminal case in court, many of these provisions are enshrined formally in the Bill of Rights. In civil court cases, there are often statutory requirements, including rules of civil procedure and rules of evidence, that ensure due process fairness.

For administrative or quasi-judicial hearings, the malleability of due process is on full display. Since *Mathews v. Eldridge* (1976), the Court has required a balancing test that considers three factors to determine if the hearing procedures are fair. These factors include the following:

> [F]irst, the private interest that will be affected by the official action; second, the risk of an erroneous deprivation of such interest through the procedures used, and the probable value, if any, of additional or substitute procedural safeguards; and, finally, the Government's interest, including the function involved and the fiscal and administrative burdens that the additional or substitute procedural requirement would entail.

This balancing test permits administrative reviews to take into account the different circumstances that exist in various contexts and adjust the notice and hearing requirements accordingly.

For example, the Supreme Court's balancing approach to due process means that a welfare beneficiary is guaranteed a hearing *before* benefits are terminated because of the significant financial harms the dependent recipient is likely to suffer. On the other hand, according to *Mathews*, a disability benefit recipient is not guaranteed a due

process right to a hearing until *after* the termination of benefits; the Court held this in part because it reasoned that a disabled worker typically has greater access to private resources and other forms of government assistance compared to a typical welfare recipient. The fact that these two situations lead to a different weighting of the interests at stake and procedural requirements to be followed helps demonstrate the flexibility that due process entails.

The *Mathews* balancing test has been used in a variety of situations. The Supreme Court has employed the balancing test to rule that the Immigration and Naturalization Service could decide whether a permanent resident alien was attempting to "enter" the country at an exclusion hearing, thus precluding the need for a deportation hearing (*Landon v. Plasencia* 1982). The Court applied the *Mathews* test to hold that a state may not remove a civil servant's property rights to employment before providing an opportunity for the worker to respond to the charges offered for termination (*Cleveland Board of Education v. Loudermill* 1985). The Court has used the test to find that a state statute that authorizes attachment of real estate without prior notice or the opportunity for a hearing violates due process (*Connecticut v. Doehr* 1991). In a very different context, the Court applied *Mathews* to hold that suspected citizen enemy combatants in the war on terror are required to be given notice of the factual basis for their classification and a fair opportunity to rebut the government's factual assertions before a neutral decision maker; according to the Court, these requirements could be met by a properly authorized and properly constituted military tribunal (*Hamdi v. Rumsfeld* 2004).

## To Whom Due Process Rights Apply

According to the terms of the Fifth and Fourteenth Amendments, any "person" is protected by due process against government action. The term "person" includes men, women, and children. However, the common sense definition that we may have of the word "person" is actually much narrower than how the US Supreme Court has interpreted the word in the due process context. Nevertheless, some classes of persons are entitled to more due process rights than others (Wasserman 2004).

For example, it is unquestioned that American citizens have due process protections under the US Constitution. Aliens, both those who are in the country legally and illegally, have due process protections as well. Following *Mathews*, though, the Supreme Court has held that the amount of due process protection guaranteed can vary among aliens who entered the country legally versus illegally. Furthermore, the Court has ruled that the government "may make rules as to aliens that would be unacceptable if applied to citizens" (*Denmore v. Kim* 2003).

Due process protects the rights of corporations too. Precedents dating back to the 1930s hold that although a corporation is not a "citizen" under the Constitution, a corporation is a "person" within the meaning of the Due Process Clause of the Fourteenth Amendment (*Grosjean v. American Press Company* 1936) and the Fifth Amendment. Labor unions, depending on the circumstances, have also implicitly been treated as "persons" with due process protections (Wasserman 2004).

## Life, Liberty, and Property: The Interests to Which Due Process Applies

Referring to the text of the Fifth and Fourteenth Amendments reveals that due process protections are at issue when one is being deprived of "life, liberty, and property." One of these interests has to be at stake for the requirements of hearing and notice to be invoked. *Mathews* again provides guidance, as the gravity of the private interest at stake may necessitate greater or lesser procedural protections.

The first category of interests is a person's life. This interest is most prominently at stake in capital punishment cases. For instance, the US Supreme Court has held that due process was violated when a trial judge, relying on a presentence investigation report that was not provided to the defense, imposed the death penalty; according to the Court, the capital sentencing

process must satisfy the requirements of the Due Process Clause, meaning at the very least that the defendant needed an opportunity to deny or explain information provided to the judge (*Gardner v. Florida* 1977). This point notwithstanding, once a court has imposed a death sentence on a duly convicted defendant, the calculus changes. In that context, the death row inmate maintains merely what the Court has characterized as a "residual life interest." This means that such an inmate could not be summarily executed by prison guards, but a death row inmate cannot challenge clemency proceedings as violating due process procedural protections, as clemency proceedings are nothing more than a "matter of grace" by the executive branch (*Ohio Adult Parole Authority v. Woodard* 1998).

Although life interests are defined rather narrowly, liberty interests are defined more broadly. At its core, a liberty interest includes freedom from bodily restraint. For example, a parole revocation involves due process liberty interests (*Morrissey v. Brewer* 1972). But according to several Supreme Court cases, it includes much more, such as being able to seek employment, to acquire knowledge, to marry, to establish a home and raise children, and to engage in freedoms protected by the Bill of Rights (Pillow 2012). Aside from protecting persons from interference with their ability to act and choose, due process protections may apply to reputational interests under certain circumstances. Reputation alone is not a sufficient liberty interest, but it does invoke due process protections when connected with a tangible interest that has been recognized by the courts or that is protected by state law (*Paul v. Davis* 1976).

The third category, property interests, has progressively expanded over time, with some limitations reached in recent years. In addition to tangible property, rights have been found in a variety of other contexts. These property interests include professional licenses and driver licenses. Until the 1970s, the Supreme Court distinguished between "rights" and "privileges," with the former qualifying for due process protections and the latter not. These "privileges" were typically government benefits. However, in *Goldberg v. Kelly*, the Court reversed course: it eliminated the distinction between rights and privileges, holding that government benefits also constitute property interests that qualify for due process protections. The Court has not left this category unbounded, however, finding in recent years that there is no property interest in the enforcement of a restraining order (Hugenberger 2005).

## Due Process and Standards of Proof

In criminal cases, the standard of proof for the prosecution at trial is the very high proof beyond a reasonable doubt. According to the US Supreme Court, this standard of proof is required to protect criminal defendants "from dubious and unjust convictions, with resulting forfeitures of life, liberty and property" (*Brinegar v. United States* 1949). The Court has found that this standard in criminal cases is required by due process, stating that due process "protects the accused against conviction except upon proof beyond a reasonable doubt of every fact necessary to constitute the crime with which he is charged;" the Court has further ruled that this standard is required in juvenile delinquency cases, given that guilty verdicts in these types of cases are similar to adult criminal convictions and have the potential loss of liberty as a possible sentence (*In re Winship* 1970).

Outside of the criminal context, the standard of proof required by due process is not quite so simple. Depending on the context, the standard of proof that may be mandated by due process may be the very deferential "preponderance of evidence" standard or the elevated "clear and convincing evidence" standard. The Court has characterized these two standards and the proof beyond a reasonable doubt standard as follows:

> At one end of the spectrum is the typical civil case involving a monetary dispute between private parties. Since society has a minimal concern with the outcome of such private suits, plaintiff's burden of proof is a mere preponderance of the evidence. The litigants thus share the risk of error in roughly equal fashion.
>
> In a criminal case, on the other hand, the interests of the defendant are of such magnitude that,

> historically and without any explicit constitutional requirement, they have been protected by standards of proof designed to exclude as nearly as possible the likelihood of an erroneous judgment. In the administration of criminal justice, our society imposes almost the entire risk of error upon itself. This is accomplished by requiring under the Due Process Clause that the state prove the guilt of an accused beyond a reasonable doubt.
>
> The intermediate standard. . .is less commonly used, but nonetheless is no stranger to the civil law. One typical use of the standard is in civil cases involving allegations of fraud or some other quasi-criminal wrongdoing by the defendant. The interests at stake in those cases are deemed to be more substantial than mere loss of money, and some jurisdictions accordingly reduce the risk to the defendant of having his reputation tarnished erroneously by increasing the plaintiff's burden of proof. Similarly, this Court has used the "clear, unequivocal and convincing" standard of proof to protect particularly important individual interests in various civil cases (*Addington v. Texas* 1979).

Thus, the Supreme Court has held that due process creates a three-tiered system of standards of proof in court, dependent on balancing the rights of individuals and the legitimate concerns of the state. The Court ruled in *Addington* that civil commitment proceedings require the clear and convincing evidence standard because the significant deprivation of liberty involved demands a standard higher than preponderance of evidence, but the government's role in protecting persons who cannot care for themselves mandates a standard less than proof beyond a reasonable doubt (*Addington v. Texas* 1979).

Finally, a fourth standard, substantial evidence, is applicable in some administrative law settings. This standard falls below the preponderance of evidence standard, requiring the decision maker to find a bare minimum of evidence to support a conclusion. The amount of proof required under this standard has been described by the Supreme Court as "more than a mere scintilla. It means such relevant evidence as a reasonable mind might accept as adequate to support a conclusion." This standard has been upheld in administrative proceedings ranging from labor disputes, Social Security Disability Insurance claims, and public school disciplinary proceedings (*Richardson v. Perales* 1971; Weizel 2012).

## Due Process and Access to an Attorney

In the criminal context, the US Supreme Court has long held that due process requires not only the right to counsel but also the right to appointed counsel for indigent defendants. This due process right developed piecemeal over time, however. Beginning in the 1930s, the Court ruled that the right of the accused in a capital case to have the aid of counsel for his or her defense is a fundamental right guaranteed by the Due Process Clause of the Fourteenth Amendment (*Powell v. Alabama* 1932). During the Warren Court's revolution of expanding rights of the accused in the 1960s, the Court extended that due process right to all felony criminal defendants, finding that indigent defendants accused of felonies have a right to appointed counsel to ensure they can put on a meaningful defense (*Gideon v. Wainwright* 1963). This right to appointed counsel for indigent criminal defendants has been broadened to any case where the defendant could face an actual deprivation of liberty, including a suspended sentence of a short jail term (*Alabama v. Shelton* 2002).

The malleability of due process, as has been explored in other contexts above, also requires different attorney access rights in proceedings that are not criminal. The Court has applied the *Mathews* balancing test to determine if appointed counsel are required in civil cases, often finding that the right does not apply. For instance, the Court has held that an indigent plaintiff had no due process right to government-appointed counsel in a termination of parental rights case. Furthermore, even in a civil commitment proceeding that could result in imprisonment, the Court has held that there is no right to appointed counsel if other substitute procedural safeguards are made available to the litigant. In these types of cases, the Court has ruled that a case-by-case approach to the question of appointed counsel meets the requirements of due process (Parkin 2014).

This case-by-case approach, following *Mathews* balancing criteria, has also been followed when determining if one has a right to an attorney, either appointed or of one's own

retention, in an administrative context. For instance, at a parole or probation revocation proceeding by a state department of corrections, one's right to appointed counsel turns on whether the agency concludes that the probationer or parolee is capable of speaking effectively for himself or herself (*Gagnon v. Scarpelli* 1973). In other administrative contexts, the right to retain one's own counsel may not even be required by due process, such as in certain public school disciplinary proceedings that could result in short suspensions. Following the notion that due process procedural requirements are to be interpreted flexibly, courts have expressed that the increased costs and delays imposed by having attorneys present at school disciplinary proceedings may outweigh the person's private interests if the penalty to be imposed is small (Mossman 2012).

## Due Process and Impartial Decision Makers

A final example of due process requirements in administrative and judicial settings is the mandate that the decision maker – whether it is a jury, a judge, or an executive branch actor – be impartial. Within the criminal context, due process mandates that a jury is impartial. For instance, if a criminal trial is dominated by mob justice to the point that the jurors fear for their lives if they acquit the defendant, the Court has held this is a violation of due process (*Moore v. Dempsey* 1923). Furthermore, if prejudicial pretrial publicity prevents a jury from being impartial, that violates a criminal defendant's right to a fair trial under the Due Process Clause (*Sheppard v. Maxwell* 1966).

In either a criminal or civil case, due process mandates that the judge presiding over the proceedings be neutral with respect to the parties appearing before the court. For example, if the judge keeps part of a fine imposed against a defendant, it is a form of bias – having "a direct, personal, substantial, pecuniary interest in reaching a conclusion" in the case – that violates the party's due process rights (*Tumey v. Ohio* 1927). In another context, a judge who receives substantial financial campaign support from a party having a case pending in that judge's court creates "a risk of actual bias" that violates due process (*Caperton v. A. T. Massey Coal Company* 2009). However, a nonlawyer judge may preside over misdemeanor cases and comply with due process if the defendant is permitted the right to appeal a conviction for a new trial before a judge who is a lawyer (*North v. Russell* 1976).

Within an administrative setting, the due process requirement of an impartial decision maker also applies, although what constitutes impartiality varies by the context. For example, a parole officer could not serve as both an investigating officer and an adjudicator at a parole revocation hearing, as that would prevent a parolee from having a case heard by an independent officer who had not already made up his or her mind (*Morrissey v. Brewer* 1972). However, the combination of both investigative and adjudicatory functions by a state medical examining board does not violate a physician's right to an impartial decision maker in a medical license suspension proceeding because the initial determination of probable cause and the ultimate adjudication in the case have different bases and purposes; in other words, they were two separate inquiries, and the first one resulted in no official decision, making the adjudication a separate matter that the same board could resolve (*Withrow v. Larkin* 1975). Nevertheless, the Court has found that the type of investigation/adjudication distinction it required in *Morrissey* is also mandated in reviews of claims of innocence by designated enemy combatants: "An interrogation by one's captor, however effective an intelligence-gathering tool, hardly constitutes a constitutionally adequate fact-finding before a neutral decision maker" (*Hamdi v. Rumsfeld*).

## Conclusion

There is no question that due process protections constitute some of the most important and

fundamental constitutional rights we possess. They ensure that one's rights to life, liberty, and property cannot be arbitrarily taken away. Indeed, due process ensures basic fairness, including rights to notice and hearing, in both judicial and administrative proceedings.

In perhaps the Supreme Court's most significant due process case, *Mathews v. Eldridge*, the Court quoted past decisions on what it called the "truism" that due process, "unlike some legal rules, is not a technical conception with a fixed content unrelated to time, place, and circumstances," instead proclaiming that due process "is flexible and calls for such procedural protections as the particular situation demands." The core of due process is that it is not a static, unchanging concept to be applied the same way to every judicial and administrative proceeding. Rather, context matters, with the rights at stake and the government interest being pursued affecting the proceedings that must be carried out to comply with due process. This case-by-case approach has long ensured that proceedings can be properly tailored, and it is an analysis that courts are likely to continue using for the foreseeable future.

# Administrative Appeal

Dacian C. Dragos
Center for Good Governance Studies, Babes Bolyai University, Cluj Napoca, Romania

## Synonyms

Administrative contestation; Administrative objection; Administrative recourse

## Definition

The administrative appeal is a request addressed to a public authority by which the aggrieved/interested person demands administrative measures to be taken regarding an administrative act: annulment, modification, or even issuance of a new act (when the latter has been refused by the administration).

## Introduction

In administrative law, there are two major ways of contesting allegedly unlawful decisions/acts: the administrative appeal and the judicial review (court action). While the administrative appeal is an attempt to solve the dispute at administrative level, the judicial review is an adversarial proceeding by which an individual transfers the conflict with a public authority to the (administrative) courts.

In principle, the administrative appeal and the judicial review are independent, and the rules for their exercise normally do not interfere with one another. Each action can be exercised separately, and those aggrieved by an administrative decision can opt freely between these two ways of contesting the decisions. In many jurisdictions, however, the applicable law requires that prior to commencing court proceedings, all administrative remedies shall be exhausted, and thus an administrative appeal must be filed. Other jurisdictions, without imposing the exercise of the administrative appeal, still link – in different ways – the administrative appeals to the judicial review – for instance, by tying the time limit for review to the solution in appeal Auby and Fromont (1971).

## Types of Administrative Appeal

The administrative appeal can be addressed to the authority that issued the unlawful act – *contestation, opposition*, *recours gracieux, appeal in reconsideration, or remonstrance* – or to its superior body, *hierarchical appeal or recourse*. There is also the so-called *quasi-hierarchical appeal*, *external appeal*, or sometimes *recours de tutelle*, addressed to an agency that is not the superior body of the issuer of the act, but has the power to control such decisions, in its quality of specialized control agency or overseeing body (the *prefect*, for instance). A variation of the administrative appeal is also the quasi-judicial appeal, regulated by special rules in different fields. It is addressed to a specialized public authority that is a combination of an administrative body and a judicial one. The decision on the appeal is still an administrative decision, issued by an administrative body, but the procedure has also features comparable to court procedures (public procurement review bodies, for instance). The administrative appeal may be used not just for administrative acts, but for administrative contracts as well, alongside with conciliation, arbitration, or mediation.

## Mandatory and Optional Administrative Appeals

From a comparative perspective, there are two major systems of administrative appeals – *mandatory* and *optional*.

The first one, adopted by a large number of legal systems (for instance, Germany, the Netherlands,

Hungary, Slovenia, Poland, Serbia, Denmark, Czech Republic, Romania, etc. Dragos and Neamtu 2014), precludes an action to court in the absence of a prior administrative appeal. At the level of EU law, in specific areas, administrative appeals are required prior to launching procedures by the Commission – regarding infringements of Union law by Member States, aids granted by Member States or when it comes to access to Union documents, appeals of servants within the Union civil service and in procedures of EU agencies. In the case of the mandatory appeal, which is more formalist than the optional one, the proceedings are to be conducted, within clear time limits, in an adversarial manner, and the final decision is subjected to extensive rules of motivation.

The second type of appeal (*recours administratif*), promoted by the French legal system and those inspired by it (partially Belgium, Italy), attaches certain effects to the exercise of an administrative appeal (prorogation of the time limits for bringing an action in a court of law) without making it mandatory (van Lang et al. 1999). The rules that govern the *optional* appeal have typically a jurisprudential source and are quite flexible. The claimant does not have to prove that there is a specific interest at stake; there usually is no requirement to conform to formal provisions, and, often, there is no time limitation for appeal.

No jurisdiction confines itself to only one system of administrative appeals. Even where the appeal is optional, there are instances where special legislation makes its use mandatory (for instance, in France – see Chapus 2008).

## The Foundations and Rationale of Administrative Appeals

The legal foundation of the administrative appeal can be found in the citizens' right to address petitions to the government, a fundamental right that has found its recognition in many constitutions or modern legislations. The right to petition is then supplemented with the administrative principle of revocation – according to which administrative decisions may be revoked by their issuer.

An administrative appeal has a threefold rationale. *Firstly*, from the perspective of public authorities, it offers them a chance to make good on their duty to reconsider allegedly unlawful acts (Serdeen and Stroink 2002); the prospective lawsuit should make public authorities assess again, perhaps more carefully than before, their initial decision; the appeal avoids formal court proceedings, the costs of a lawsuit, and possibly having to pay compensation – not to mention the prospect of having its image affected by losing a lawsuit. *Secondly*, administrative appeals evidently protect in the same time private parties who have allegedly been aggrieved; thereby, proceedings offer the participants the possibility of having a disputed decision annulled in a simple, fast, and free of charge proceeding. In this respect, the administrative appeal is usually much more beneficial for individuals than court trial. On the other hand, if the appeal is flatly rejected by the public authorities, the claimant has an opportunity to reassess his/her chances of winning in court and make a more informed decision in this direction, based on the reasoning put forward by the public authority – it basically provides a test-run for a full-blown court trial. *Thirdly*, the court's excessive caseload is sensibly eased when administrative appeals do their job in keeping parties out of court.

The worst-case scenario, as far as the rationale for administrative appeals goes, is when the public authority is silent in response to the administrative appeal – *administrative silence*. In such a case, the claimant will confront the public body for the first time in court, without being able to benefit from a test-run during administrative appeal proceedings. Even in this case, the administrative appeal must receive some consideration in the course of the court proceedings, in the sense that the attitude of the public authority could be deemed culpable. The administrative silence should be considered when deciding on the costs of litigation. The judge should address separately the fact that the public authority has not answered the administrative appeal in due time, consequently pushing the claimant to go to court. The other variant is that the party desists altogether because of cost of court litigation, in which case the administrative appeal has not had the envisaged effect.

Besides protecting the public authorities (and, hence, the public interest) and private parties by allowing public authorities to reform allegedly unlawful acts, the second important function of administrative appeals is relieving administrative courts of cases that can be solved at administrative level.

Another argument as to administrative appeals being more suited for solving administrative disputes than courts comes from the fact that judges may not always have the ability to grasp the full realities of the public administration, especially in the context of the extraordinary development of the tasks performed by public bodies, and that public administrators are better equipped to do this.

A noticeable advantage of the administrative appeal in those jurisdictions that pay reverence to the legality principle is its wide scope. The claimant can invoke not only legality aspects but also opportunity ones or issues pertaining to the principle of good administration, while as in court, the decision will be mainly assessed by applying legality standards. The administrative appeal can resort also to the "benevolence of the administration" (Brabant et al. 1973) in order to resolve the matter, where no strong legality arguments can be put forward.

## The Scope of the Administrative Appeal

The scope of the administrative appeal refers to the extent of powers bestowed upon the appellate body. The final objective of the appeal from the perspective of the appellant is first and foremost the *revocation* of the decision. It could also refer to the alteration of a decision or *issuance* of a new decision. However, the possible outcomes of an administrative appeal procedure range from dismissing the request to upholding the individual administrative act or to disregarding the appeal altogether.

The outcome of the appeal can be looked at from two angles: for the claimant it is intended to provide revocation or amendment of the decision, but a clarifying response of the public authority explaining that the decision is legal can also deter the claimant to challenge the decision in court. Very hard to determine are cases when the claimant renounces the court action even if the decision is unlawful and the administrative appeal was rejected. In this case, the decision not to go to court is only partially a result of the administrative appeal, because the aggrieved person did not intend to go to court anyway.

If the decision was revoked by the issuer or annulled by the superior body, the claimant has the possibility to file a court action for compensations, so the matter is often not solved entirely at the administrative level. Here, the question is whether public bodies can decide upon compensations themselves and put an end to the dispute for good. Administrative bodies are usually reluctant to allow the settling of compensation claims during administrative proceedings, due to legal culture, established administrative practices (Dragos and Neamtu 2014).

The powers of the appellate body depend on their positioning within the administrative system. The appeal to the issuer usually presupposes the widest powers of dispute resolution, because the issuer can decide upon its own acts (in principle) freely. The appeal to the hierarchical body is also quite wide in its scope, regardless of how the supervisory powers are defined in general in a given administration. Consequently, even where in principle superior bodies cannot interfere with their subordinate bodies except for giving guidance and for cases when the law expressly states otherwise, the administrative appeal has a *devolutive* effect, which means that the appellate body is entrusted with deciding the matter de novo, without being bound by the findings of the issuing body.

Another aspect of the scope of the review regards the application of the principle of *non reformatio in pejus*. The question here is whether public authorities may worsen the situation of the applicant in its (his/her) own (administrative) appeal.

The question is therefore whether the appeal should be dealt with by the public body within the confines of a *bound competence*, meaning that the appellate body is held to answer the claimant only within the limits of the request, or whether the authority can consider itself notified for an

analysis de novo of the decision, which implies the power to modify the decision in a way that may not be to the advantage of the applicant.

Mixed offerings are on the table also for the application of this principle. For instance, the possibility to reform an administrative decision against the interest of the claimant is allowed in Germany, with restrictions in some cases and with different solutions in the federated states (Stelkens 2014). In France, it is possible as a rule, but only if the decision creates other rights (Bousta and Sagar 2014). In the Netherlands, the principle applies fully to the objection and administrative appeal proceedings, as being a specific application of the principle of legal certainty. This applies only with regard to the appellant, and not to third party interests; conversely, if third parties are the appellants, it does not apply to the beneficiary of the original decision. A *reformatio in peius* is however permissible if the authority has generally the competence to amend at any time and also ex officio the contested decision to the detriment of the applicant (Langbroek et al. 2014).

Another question that can be raised in the context of the scope of the administrative appeal is whether the appellant can *modify* the scope of the review when reaching the court or the review should rather match the scope of the administrative appeal. In the comparative law, approaches differ: in Italy, for instance, the scope of administrative appeal has to be observed when lodging the court action: the claimant cannot modify the reasoning from the administrative appeal and invoke other grounds for judicial review (Comba and Caranta 2014). In France, the administrative appeal "crystallizes the judicial review," because the plaintiff will not be able to invoke other grounds than those invoked in the administrative appeal, except for public order grounds (Chapus 2008).

## The Suspensive Effect of the Administrative Appeal

The suspensive effect means that the administrative appeal stays the execution of the contested act. The Council of Europe's Committee of Ministers 2001 recommendations state that "[national] regulations may provide that the use of some alternative means to litigation will in certain cases result in the suspension of the execution of an act, either automatically or following a decision by the competent authority." There are two options for the suspension: automatic suspension or suspension decided by the appellate body or court.

The automatic suspension of the challenged administrative act is promoted in a number of jurisdictions (Germany, Poland, Slovenia, Hungary, Serbia, and the Czech Republic), while other jurisdictions have opted for the opposite solution: the appeal has no suspensive effect, but the suspension can be granted expressly by court order, usually in an expedited procedure (France, the Netherlands). In other cases, the suspension can be decided by appellate public bodies or by courts (Italy, Belgium, Denmark, Spain, Romania) (for details, see Dragos and Neamtu 2014).

## Conclusion

A chief feature of administrative justice is that it allows parties to resolve their dispute at the administrative level: they have the possibility to challenge the decision before the administration itself prior to resorting to courts. The administrative appeal may be included, in a broad sense, in the category of *alternative dispute resolution* (ADR) tools for the realization of the administrative justice, when compared to the resolution of the disputes by courts; it has been strongly recommended by the Council of Europe (Recommendation 2001) and has found its way into most of the jurisdictions.

There is no easily accessible empirical research measuring the effectiveness of administrative appeals. Few texts that dare to tackle the issue are just assumptions based on perceptions. Generally, their potential role is reducing the caseload of the courts while still securing a fair access to justice (Recommendation 2001). The literature that tangentially touched upon the issue describes only the organization of the administrative

appeals in various jurisdictions, without analyzing their influence on the judicial review and their effectiveness as ADR tools.

However, one study (Dragos and Neamtu 2014) tried to present empirical evidence from 15 European countries and the EU on the effectiveness of administrative appeals. Overall, the main conclusion is that when organized, administrative appeals are fulfilling their role as ADR tools or pretrial proceedings. They offer a good venue for seeking legal protection while playing also the role of pretrial procedures. However, their ability to provide legal protection comes with mixed blessings: there is sometimes reluctance to consider them as ADR tools because their role as legal remedies is well enshrined in the legal tradition of some legal systems and their status is rivaling the courts' (in Germany, Austria, Denmark, Slovenia, Serbia). Unorganized administrative appeals are nevertheless important, either as a venue for seeking alternative dispute resolution or as informal procedures destined to keep parties out of courts of law. In France, the Conseil d'Etat has asked for the generalization of mandatory administrative appeals, but this move is resisted due to French administrative law traditions.

When compared to other tools of ADR, like Ombudsman and mediation, arbitration, and conciliation, the administrative appeals still hold the spotlight in the majority of jurisdictions.

# Administrative Autonomy of Public Organizations

Tobias Bach
Department of Political Science, University of Oslo, Oslo, Norway

## Synonyms

Administrative discretion; Agency independence; Bureaucratic autonomy; Delegated authority

## Definition

Administrative autonomy refers to public organizations' ability to determine their own preferences and to translate those preferences into authoritative actions. The concept describes a relationship between an organization and a set of actors outside the organization, most importantly elected officials and executive politicians.

## Introduction

This chapter provides an overview of what is known about the administrative autonomy of public organizations. Broadly defined, administrative autonomy refers to public organizations' ability to determine their own preferences and to translate those preferences into authoritative actions (Maggetti and Verhoest 2014). However, public organizations are never completely isolated from other actors within the political system (Wilson 1989). They are part of a chain of delegation from the voters to elected officials to departments (ministries) and other public organizations. Yet another important relationship refers to the distance from public organization's clients or regulatees. Here, the question is whether the organization is captured by the very interests it is supposed to regulate, taking a lenient approach and acting as an advocate for those special interests. This is an important aspect for understanding public organizations, yet the remainder of this chapter will focus on public organizations' relationship to elected officials, in particular executive politicians (ministers).

The chapter distinguishes between two analytical perspectives on administrative autonomy. A top-down view focuses on the formal autonomy of public organizations, which is defined by the formal authority delegated to an organization by political decision-makers (Yesilkagit and Christensen 2010). In contrast, a bottom-up view focuses on the actual scope of an organization's decision-making powers, which may also include its ability to shape the preferences of political decision-makers (Verhoest et al. 2004). The actual autonomy of public organizations is based on the endogenous development of preferences and their ability to cultivate a coherent mission and legitimacy among stakeholders (Carpenter 2001; Wilson 1989).

The following sections introduce each perspective and illustrate different empirical dimensions of formal and actual autonomy, respectively. Then the chapter provides an overview of theoretical explanations of differences in both formal and actual administrative autonomy across public organizations. The subsequent paragraph sketches what is known about the consequences of administrative autonomy for crucial aspects of modern government.

## Delegated Authority: The Formal Autonomy of Public Organizations

The formal autonomy of public organizations can broadly be understood as their distance from elected officials, with higher degrees of formal autonomy implying fewer powers of elected officials to direct the organizations' conduct. From this top-down perspective, administrative autonomy is the result of delegated authority by political decision-makers, who are primarily concerned with ensuring political control over the permanent bureaucracy. The dominant theoretical paradigm for the analysis of delegated authority is the principal-agent approach, which theorizes on the relationship of a political principal that delegates a specific task to a bureaucratic agent (Pollack 2002). In such models, the agent's autonomy is little different from public organizations' discretion to take decisions within a limited policy space without interference by political principals. A core focus of this literature is the problem of moral hazard, i.e., bureaucrats' inclination to put as little effort as possible into performing their tasks or to misuse their informational advantages to pursue their idiosyncratic policy preferences.

Just how much formal autonomy a public organization has will depend upon the organization's formal-legal status, the degree to which delegated policies are rule based or based on policy results to be achieved, and the procedures to be followed when taking authoritative decisions, among others. Hence, formal mechanisms of political control over the bureaucracy (which define its formal autonomy) may be related to different aspects of public organizations and their activities. This multidimensional nature of administrative autonomy has several implications for both formal and actual autonomy. Most importantly, speaking about administrative autonomy in a general sense bears the risk of conflating different dimensions of autonomy. These dimensions tap into different aspects of organizational activities,

making their aggregation into one single measure of organizational autonomy highly questionable (Gilardi 2008; Hanretty and Koop 2012).

Another implication is that different dimensions of autonomy may vary independently from one another. For instance, an organization may have low autonomy in managerial terms but high autonomy in terms of policy discretion (Verhoest et al. 2010). Indeed, a high degree of policy discretion resulting from restricted powers of politicians to interfere in agency decision-making (and hence transferring powers away from elected officials to technocratic decision-makers) is the essence of the term "independence" which is often used as a synonym of autonomy (Roberts 2010). Among others, the term is used for "independent central banks" as well as "independent regulatory agencies" tasked with the enforcement (and sometimes development) of binding rules regulating economic and social activities (Gilardi 2008).

A common way to study public organizations' formal autonomy is to locate them on a continuum from departments (ministries) headed by elected officials to entirely private organizations that are beyond the discretionary control of elected officials, such as private companies. The classification of different types of "animals in the administrative zoo" (Bach and Jann 2010) is motivated by the observation that many public services are delivered by organizations that are not archetypical government bureaucracies but that somehow operate at the fringes of the public sector. For instance, van Thiel (2012) proposes a continuum including central government organizations (such as ministries, departments, directorates general), semiautonomous organizations without legal independence, legally independent organizations based on statutes, and either private or public law-based and private law-based organizations established by or on behalf of the government. The bottom line is that a location on the continuum further away from elected officials imposes greater restrictions on the latter for interfering into administrative decisions.

But what exactly makes some types of public organizations more formally autonomous than others? As a rule, organizations at different positions on the continuum of formal autonomy display distinct features potentially limiting political interference. That said, political decision-makers tend to be creative when designing public organizations, thereby diminishing the "fit" of formal-legal type and formal autonomy (Christensen 2001; Döhler 2002). One aspect of formal autonomy is the existence of a governing board that appoints and oversees the agency head, interrupting the direct chain of command from the minister to the head of the organization (Yesilkagit and Christensen 2010). Likewise, the term of office of the board members and the head of the organization has been shown to be powerful measures of formal autonomy (Hanretty and Koop 2012). Another measure of formal autonomy is the delegation of formal decision-making powers to an organization by law – either for single-case decisions or for issuing general regulations – and hence forbidding ministerial interventions into the organization's decision-making (Christensen 2001). These (and other) measures of formal autonomy have in particular been used in research assessing the formal autonomy of regulatory agencies (Gilardi 2008; Yesilkagit and Christensen 2010), inspired by empirical research on central bank independence. However, the focus of the top-down approach on formal mechanisms of political control over the bureaucracy also means that it pays little attention to what is happening within public organizations, which is at the core of the bottom-up approach.

## Beyond Formal Design: The Actual Autonomy of Public Organizations

The actual or de facto autonomy of a public organization can be defined as its actual decision-making powers with regard to a specific subject matter or dimension (Bach 2014). As opposed to the top-down perspective outlined above, the study of actual administrative autonomy considers delegated powers as one element of an organization's decision premises among others. For instance, several scholars have observed the empirical puzzle that organizations with similar degrees of formal autonomy display nontrivial

degrees of variation in their actual autonomy (Maggetti 2012; Verhoest et al. 2010; Yesilkagit and van Thiel 2008). A widespread method for studying actual administrative autonomy is through organizational surveys tapping into different dimensions of public organizations' actual decision-making powers. This method has been used in internationally comparative studies of public organizations more generally (Bach 2014; Verhoest et al. 2010), as well as in studies of regulatory agencies (Maggetti 2012). Arguably, organizational surveys are well suited to measure actual autonomy in day-to-day decision-making and to study drivers of autonomy across a broad range of organizations. Yet surveys perform less well in capturing the dynamics of critical events that put into question the organization's established way of functioning (Selznick 1957).

A typical challenge to public organizations' established mode of operation is a looming reform of the organization's sphere of responsibility, such as organizational mergers or the design of new policies. In such situations, highly autonomous public organizations will be able to shape the outcome of the decision-making process. This is the core of Carpenter's concept of bureaucratic autonomy, which he defines as a situation in which "a politically differentiated agency takes self-consistent action that neither politicians nor organized interests prefer but that they neither cannot or will not overturn or constrain in the future" (Carpenter 2001, p. 17). The ability to shape policies according to distinct organizational preferences and to translate those preferences into authoritative actions can thus be seen as the conceptual core of actual administrative (or bureaucratic) autonomy.

Moreover, Carpenter (2001) emphasizes the endogenous creation of bureaucratic preferences, the development of unique organizational capacities, and the ability of public organizations to create and maintain legitimacy among relevant stakeholders as key conditions of bureaucratic autonomy. In particular, he emphasizes the ability to create a reputation for the uniqueness of the organization's capacity as a key factor which enables the organization to take decisions in line with its preferences or even to change its formal mandate through strategical coalition building. An organization's actual autonomy is not simply the sum of delegated powers but the result of a gradual process of institutionalization through which the organization acquires a distinct identity and a coherent organizational mission that may diverge from its original mandate through an evolutionary process (Selznick 1957). According to Wilson (1989), a further characteristic of highly autonomous organizations is an undisputed jurisdiction (or "turf") with few rival organizations and few constraints imposed by political office holders.

The gradual process of institutionalization after the formal creation of a public organization, especially the creation of external legitimacy among stakeholders, can be deliberately shaped through managerial strategies. Groenleer (2014) lists four such strategies: (1) differentiation from other organizations by cultivating the uniqueness of the organizations capacities, (2) moderation with regard to asserting the organization's autonomy vis-à-vis political superiors, (3) the careful balancing of (potentially conflicting) demands of various audiences, and (4) networking with other organizations, under the condition that those relationships are cooperative and based upon common or complementary interests. Hence, a strategy of cooptation of stakeholders may counterintuitively lead to higher rather than lower levels of actual administrative autonomy (Groenleer 2014; Selznick 1957).

An important element of this comprehensive understanding of bureaucratic autonomy is that public organizations are relevant players in the political process of delegation. As shown by Wilks and Bartle (2002), competition authorities in Europe that were created for largely symbolic reasons have over time had a significant impact on policy outcomes and legislation: "The consequence of creating agencies has been to populate the policy area with actors (agents) who have their own priorities, interpretations, and influence" (Wilks and Bartle 2002, p. 149). More often than not, decisions to delegate authority take place in a crowded space, filled with existing policies and organizations. To defend their institutional interests, existing public organizations strive to match

their mission to their jurisdiction. As a result, organizations may try to fight off new tasks that do not match the organization's mission or to prevent the creation of rivaling organizations (Wilson 1989). For instance, scholars of international organizations have studied processes of organizational change as driven by these organizations' desire for bureaucratic autonomy (allowing them to pursue and expand their mandate), which has to be traded off against the need of resources to sustain the organization's activities (Barnett and Coleman 2005). However, the kind of strategies those organizations may (successfully) pursue will depend on the availability of resources and the match of the organization's mission and external demands. In sum, public organizations may develop into highly autonomous institutions, yet this is not the case for all organizations.

## Theories of Administrative Autonomy

Why do policy-makers delegate tasks to formally autonomous organizations instead of having them performed under the direct hierarchical control of elected officials? And under which conditions do legislators grant high levels of policy discretion, instead of writing detailed legislation themselves? These questions call for theoretical accounts of delegating formal autonomy to public organizations.

A first set of explanations is functional: policy-makers delegate authority for reasons of policy effectiveness that could not be achieved if tasks were performed by less autonomous organizations. A prominent argument is that delegation to politically independent organizations – i.e., organizations for which elected officials ultimately lack discretionary powers to intervene directly in single-case decisions – is used by policy-makers to credibly commit themselves to long-term policy objectives (Gilardi 2008; Majone 2001). The key rationale is that private companies are only willing to invest in a market if they can expect policy stability. This reasoning is essentially skeptical toward elected politician's ability to pursue consistent preferences over time (Roberts 2010). A related argument emphasizes the need for specialist expertise in complex policy areas. Accordingly, direct political control over administrative decisions in technically complex areas is likely to produce ineffective policies. Moreover, there is little electoral payoff for politicians engaging in highly complex policy issues (Elgie and McMenamin 2005).

A second explanation is that organizations operating at arm's length from elected officials are simply more efficient than less autonomous organizations. There are several arguments linked to this explanation. For instance, structurally disaggregated organizations may be freed from the straightjacket of public sector regulations (personnel, budgeting) which will lead to efficiency gains. Another argument is that separating policy and operations in a more clear-cut way will increase professionalism and results orientation in executive organizations. To be sure, the latter argument is not directly related to formal administrative autonomy, yet it was especially prominent among proponents of the creation of "executive agencies" in a number of countries (Pollitt et al. 2004).

Third, several scholars analyze decisions to delegate authority as a contentious political process (Moe 1990). Accordingly, legislative decision-making is about which powers to delegate and on what control mechanisms to establish in order to influence the substance of bureaucratic decision-making (Pollack 2002). The policy conflict thesis relates to agencies' formal autonomy reflecting the degree of policy conflict at the time of their creation, with more conflict allegedly leading to lower levels of formal autonomy. The political uncertainty thesis emphasizes that policy-makers will delegate more formal autonomy to public organizations if faced with the prospect of losing their electoral majority (Moe 1990). Formal autonomy may thus be used to prevent political opponents from controlling administrative decision-making after taking power. The empirical evidence for these explanations is mixed, though what can safely be said is that they are more robust in the US context than in parliamentary systems of government (Yesilkagit and Christensen 2010).

A fourth set of explanations is rooted in organizational sociology and in theories of policy diffusion. The bottom line is that autonomous organizations are created because that is perceived as the appropriate way of organizing in the public sector at large or in a specific segment of the public sector. Some prominent examples are the worldwide trend of creating regulatory agencies (Gilardi 2008) and the delegation of executive, service delivery tasks to bodies operating at arm's length from elected officials (Pollitt et al. 2004). Another important mechanism of how formally autonomous organizations spread can be located within a single context, namely, the use of "blueprints" in organizational design (Döhler 2002; van Thiel 2004; Yesilkagit and Christensen 2010). The underlying mechanism is that the creation of new organizations, or the reform of existing organizations, follows templates of organizational design that have been used before. This argument is backed by several empirical studies in the European context, which also indicate a rather limited explanatory power of political explanations of delegation.

Finally, delegation to formally autonomous organizations may be linked to political motives, though not in terms of ensuring political control over agency decision-making but rather in the sense of avoiding or diluting political responsibility. From this perspective, delegation is understood as a strategy of blame avoidance through the ingenious design of public organizations (Hood 2011). The bottom line is that formally autonomous organizations may function as "lightning rods" in the case of mishaps, scandals, and crises (Pollitt et al. 2004). Whether they can ultimately fulfill this function will however depend on whether elected officials can credibly claim that they have no (or limited) responsibility in overseeing a formally autonomous organization. However, empirical research shows that institutional design involving the formal delegation of authority may change the attribution of blame and credit in the long run (Mortensen 2013). That said, it is almost impossible to establish empirically whether decision-makers deliberately designed formal structures to diminish blame or whether this is a mere by-product of other motivations.

The above mentioned factors have been used in research seeking explanations for the decision to delegate formal autonomy to public organizations. However, explanations for public organization's actual autonomy are quite different. To be sure, there are different research traditions in the study of actual administrative autonomy. The tradition based on in-depth studies of a small number of public organizations (e.g., Barnett and Coleman 2005; Carpenter 2001; Groenleer 2014) stresses the careful deployment of managerial strategies to generate the support of relevant stakeholders and the development of a unique organizational identity as key conditions of administrative autonomy. Put differently, actual administrative autonomy is acquired as a consequence of the process of institutionalization of formal organizations ingeniously described by Selznick (1957). However, these studies do not always make a clear distinction between the drivers of actual autonomy, such as the cultivation of external legitimacy or the coherence and uniqueness of the organization's mission, and actual autonomy as a consequence of those conditions.

The remainder of this section focuses on the literature using a somewhat narrower understanding of autonomy: an organization's actual decision powers with regard to a specific subject matter. This literature often uses survey data (e.g., Verhoest et al. 2010) or case studies aiming at making generalizations across a broader set of organizations (e.g., Pollitt et al. 2004). The relationship between formal and actual autonomy is among the most pertinent issues within this strand of research: do different levels of delegation of formal autonomy make any difference for actual decision-making by public organizations? In particular, scholars have investigated whether differences in formal autonomy, either measured as the position on the continuum of formal autonomy (Painter and Yee 2011; Verhoest et al. 2010; Yesilkagit and van Thiel 2008), the statutory protection from political interference (Bach 2014), or a more complex index of formal autonomy (Gilardi 2008; Maggetti 2012) has a systematic effect on actual levels of autonomy. The results of

these studies are mixed: formal autonomy does sometimes affect actual autonomy, but not in a linear way. For instance, organizations that are further away from the core bureaucracy do not necessarily report higher degrees of formal autonomy (Yesilkagit and van Thiel 2008). Moreover, the effect of formal autonomy depends on the dimensions of autonomy under scrutiny. The legal protection from political interference is likely to provide an organization with greater policy autonomy (Christensen 2001), but not necessarily with greater managerial autonomy (Bach 2014). The limited explanatory power of formal autonomy, i.e., constraints on elected officials' direct intervention in administrative decision-making, points toward supplementary explanations of actual autonomy.

A key explanation for variation in actual autonomy is that elected officials do not prioritize the exercise of control over public organizations equally. Some public organizations are almost constantly on the radar of elected officials, whereas others are hardly known to the general public (Pollitt et al. 2004). The political salience of what agencies do may be related to different aspects, such as direct contact with substantial parts of the population (e.g., social services) or a large size in terms of budget and personnel. However, despite the intuitively high relevance of political salience for actual agency autonomy, there are only few studies that establish a causal relationship between the two, one explanation being the highly volatile nature of political salience: what is high on the political agenda changes quickly and so does the attention of elected officials.

More generally, scholars have elaborated on the relevance of public organizations' task characteristics for their actual autonomy (with political salience being one aspect of how tasks affect actual autonomy). These studies emphasize the degree to which the actions and effects of what public organizations do are observable (Wilson 1989) and the degree to which tasks are highly technical in nature (Pollitt et al. 2004). All else being equal, the expectation is one of higher actual autonomy for organizations with tasks that are difficult to observe (and hence hard to measure) and hardly intelligible for lay politicians. Yet again, empirical research using task as explanatory variable leads to mixed results (Bach 2014; Painter and Yee 2011; Verhoest et al. 2010). This may be related to coarse empirical measures, different definitions of tasks, but also to the fact that public organizations usually perform multiple tasks (van Thiel and Yesilkagit 2014).

Finally, turning to resources of public organizations that may enable them to resist hierarchical control and to carve out actual administrative autonomy, there is a growing body of research showing that the involvement of national public sector organizations in transnational administrative networks increases their (policy) autonomy vis-à-vis their domestic hierarchical superiors (Bach et al. 2015). Their membership in transnational networks not only provides national organizations with additional expert knowledge, thereby increasing the information gap between political principals and bureaucratic agents, but they also enable them to play a two-level game by strategically exploiting their knowledge on other participants' policy positions.

## Consequences of Administrative Autonomy

Having discussed some of the main drivers of administrative autonomy, both formal and actual, this chapter now addresses the consequences of administrative autonomy. In contrast to the rich empirical findings on the drivers of autonomy, empirical findings on the effects of autonomy of public organizations are more scattered. The delegation to a public organization outside a government ministry is perhaps one of the simplest measures of formal autonomy. As shown by Egeberg and Trondal (2009), employees in structurally disaggregated agencies pay significantly less attention to political considerations than their colleagues in ministerial departments when taking decisions. Hence, formal organizational autonomy impacts on the priority setting of officials.

Another view emphasizes the political usefulness of formal autonomy for different actors in the politico-administrative system (Christensen 2001). For instance, the existence of a board may blur lines of political accountability for a minister, potentially diffusing blame for failures and scandals (Hood 2011). Formally autonomous organizations can effectively serve as blame magnets for allegations of policy failures and mismanagement (Mortensen 2013). As shown by Overman (2016a), whether public tasks are performed by formally autonomous organizations or by government ministries has no discernible effect on citizens' satisfaction with the services provided by those organizations. Yet citizens' dissatisfaction with services provided by formally autonomous organizations does not have the same negative effects on their dissatisfaction with government as a whole, thus effectively absorbing blame.

Finally, turning to the effects of delegation to formally autonomous organizations on economic variables (such as effectiveness of task performance) or organizational variables (such as staff motivation and flexibility), there is no conclusive evidence supporting those relationships (Overman 2016b). This is rather intriguing, given the great emphasis placed by policymakers on the various beneficial effects of delegation (Pollitt et al. 2004). Likewise, a study investigating the effect of the degree of independence of competition regulators on policy outcomes finds no significant effects, thus questioning the credible commitment assumption of better regulatory performance caused by high formal autonomy (Guidi 2015). In sum, the overall picture regarding the ability of autonomous public organizations to deliver expected results is mixed. Yet what can be safely concluded is that delegation to autonomous organizations changes the institutional landscape and creates new political actors (Moe 1990; Wilks and Bartle 2002). These organizations may develop into institutionalized organizations that protect their institutional interests and may ultimately affect policy outcomes, though perhaps in different ways than anticipated by their creators (Carpenter 2001; Wilson 1989).

## Conclusion

The public sector in contemporary societies is composed of a usually large number of formal organizations. These organizations vary in terms of their formal status and delegated powers, and administrative reforms often consist of a redrawing of organizational boundaries. At the same time, public organizations are more than simply the creatures of elected politicians' choices. As any formal organization, they will accumulate specialist knowledge, strive for survival, and develop a distinct institutional identity. In consequence, understanding the causes and consequences of administrative autonomy – both formal and actual – is essential for a complete account of policy-making in the modern state.

## Administrative Discretion

Eric E. Otenyo
Northern Arizona University, Flagstaff, AZ, USA

### Synonyms

Administrative circumspection

### Definition

Phillip Cooper defines administrative discretion as the "power of an administrator to make significant decisions that have the force of law, directly or indirectly, and that are not specifically mandated by the Constitution, statutes, or other sources of black letter law" (Cooper 2000, p. 300).

## Introduction: What Is Administrative Discretion and Why Does It Exist?

In practice, public administrators have a few situations in which they do not apply discretion. High-ranking administrators such as superintendents of school districts and city managers, among others, know that at times, situations may arise in operations and program implementation processes in which existing administrative regulations or legal procedures are inadequate or inappropriate. Use of discretion becomes necessary, especially in situations in which immediate action is needed. For the most part, frontline or street-level bureaucrats work in situations where discretion is required because the rules and laws are too complicated and may not be adequate in specific cases. However, no administrator and manager in public service is said to have complete discretion. The Constitution just doesn't allow that to happen.

In administrative law, discretion has multiple meanings and uses. In some instances, discretion refers to the act of individualizing decisions when administrators apply rules. In other words, an administrator "fills" in the "hole" left because the law fails to guide decisions in certain cases, in part because of statutory ambiguity. Experts note that statutory ambiguity exists for various reasons.

For instance, legislative bodies face time constraints and do not have all the information to write laws that cover all situations. Lawmakers are also ignorant of future events and must confront the possibility of unsolvable technical problems. It is widely held that law can become outdated quickly. Moreover, the social and economic heterogeneity of the electorate makes it difficult for a law to serve all groups equitably. It is also well known that lawmakers work toward political consensus and the need for compromise; therefore, the law attempts to capture a host of scenarios and situations and might be symbolic, if need be. In other words, laws are often expressed in broad and vague terms, rendering different interpretations by administrators. In point of fact, no one can anticipate all possible conditions or situations around an event or policy issue. Still, laws must confront the reality of language fallibility, which makes statutory precision elusive (MacIntyre 1986). Therein, above lies some of the explanations for the existence of discretion.

Additional accounts on why discretion is necessary may fall within two broad lenses. One, public administration scholars argue that providing officials discretion enables them to do their work efficiently. After all it assumed they are the professional experts and have delegated authority from legislative bodies. The argument is that the more discretionary authority is available, the greater the chance that an administrative action will result in efficiency and effectiveness. Thus, merit of discretion is that officials will tune decisions to suit variations in the administrative environment. This line of thinking informed many of the reforms aimed at de-bureaucratization with goals of speedier administration. That was one of the intents of the National Performance Review, which focused on administrative discretion for customer satisfaction.

Even if it was possible for public administrators to successfully implement all policies enshrined in law, governments across the nations continue to face intractable challenges. The ability to solve "wicked" problems necessitates discretionary actions. Wicked problems by nature have no agreed-upon definitions and solutions. An excellent example of such problems is immigration and migrations which continue to affect many nations. Handling these problems requires much thought and due considerations of justice, fairness, and compassion.

## Administration Discretion in Street-Level Situations

According to Lipsky (1980, p. 15), street-level discretion promotes workers' self-regard and encourages clients to have greater trust in workers rendering a service. Street-level bureaucrats like policemen, firemen, teachers, social workers, and others work in situations that often require responses to the human dimensions of situations. No case is exactly like another and the

administrator must evaluate a client in specific and unique ways.

Street-level officials especially those providing a service are prone to asking questions about *who* really deserves a benefit action or preference in service provision. In other words, public officials make judgments about the people they serve. Research shows that client characteristics are one of the influences in determination of award of benefits and services. As a consequence, street-level bureaucrats bend or ignore rules and practices just to disburse a service or benefit. Stories written on this subject reveal that street-level officials ask questions about "who is the deserving poor?" And they may make subjective decisions depending on whether a needy person is in that situation because of moral failing such as drug abuse or sloth or because of other more "acceptable" reasons.

Discretion is really about flexibility in policy implementation. Administrative "discretion is especially necessary because the technical expertise that is the basis for a good deal of administrative activity is constantly changing" (Cooper 2000, p. 303). Administrators have to react quickly to changing situations and make decisions that fit existing technological, economic, and social environments.

Discretion is about individualized treatment and attention to issues. And especially discretion plays a key role in criminal law all over the world. Traditionally policing was done "by the book" that is enforcing violations according to written rules and laws. Yet, police work is complex and discretion was at the core of decisions made. Police deal with so many unique individual cases and it is impossible to follow the law to the letter.

Individualized and differentiated applications of the law have recently become the focus of alleged incompetent policing in areas with minority populations. Police are said to abuse their discretion by manhandling African Americans who commit minor traffic violations. Police have also been reported to issue tickets where justification is questionable. For example, an elderly woman was issued a ticket for obstructing traffic as she crossed a street in Los Angeles (Vaughn and Otenyo 2007, p. ix).

Another area through which we can discern the applications of discretion in public administration is how different agencies have interpreted the Americans with Disability Act, ADA (1990). The law as written was not precise in its definition of who qualified as a disabled person. Indeed, the estimated number of "disabled" persons ranges from 25 to 100 million and depends on who frames debates about disability. In 2010, for example, the Census Bureau reported that one in five Americans have a disability. Accordingly, 56.7 million, roughly 19% of the population, would be covered under the ADA statutes.

Even though the numbers of those considered disabled are large, the levels of disability make it impossible for administrators to offer services in an equitable manner. Granted that the law prohibits discrimination against individuals based on disability, there is considerable vagueness concerning the levels of physical or mental disability existing in society. This is the reason why the Department of Justice continues to issue regulations to help agencies interpret the ADA. And still, the DOJ recognized that it was impossible to develop a list of all impairments.

## Managerial Actions and Policymaking Discretion

At the managerial and executive level, discretion takes many forms and shapes.

It can be in areas such as executive appointments, use of veto powers, and crisis management. Chief executives are known to use discretion in policymaking matters. When discretion is about policymaking, such authority must be expressly provided for in law. Policymaking goes beyond the power to extend legislation or filling in details for ease of implementation. Policymaking expands the work done by legislative bodies. Policymaking discretion involves considerations about the public interest and the expertise of the bureaucracy. For example, in emergency situations, the public relies on the guidance of experts to help secure public safety. A case in point is the reliance on experts from the

Center for Disease Control and Prevention (CDC) during outbreaks of dangerous communicable diseases.

Discretion is inevitable to allow for sufficient creativity and latitude to ensure effective operations of public organizations. Yet policymaking discretion has a lot to do with politics. Public managers respond to exhortations from politicians to take certain actions based on ideological positions. Politics affects managerial discretion in more than one way. Consider, for example, where policy level executives have made decisions on a purely discretionary basis. A case in point is the example of Sherriff Joe Arpaio in Maricopa County, Arizona, who ordered inmates to wear pink underwear because he believed that the color made it difficult for them to be undetected.

In recent times, governors, as policymakers, have made political decisions to reject or accept provisions of the Patient Protection and Affordable Care Act (2010), sometimes using their discretion, in line with political calculations. Different governors including Republican Rick Scott of Florida announced he would not agree to Medicaid expansion as promoted in the law. But he changed his position in 2013 to argue that he would support expansion of Medicaid because his conscience would not allow him to deny access to the uninsured. Governor Scott flipped again, in 2015, this time announcing that he did not trust the federal government would keep its commitments. Such is the nature of political expediency, which can in some ways reflect on leadership and the use of discretion.

## Administrative Discretion and the Courts

As Charles Koch Jr. notes, "administrative law is dominated by the term discretion" (1986, p. 469). There is a large body of administrative law to illustrate how discretion has played out in the courts. In *McAuliffe* v. *Mayor of New Bedford* (1892), the court ruled that city ordinances did not have a precise language that controlled the mayor's discretion in issuing permits. A preacher, who had violated a municipal ordinance, addressing the public without securing a permit, had sued the mayor. Among the earliest cases was *Morgan* v. *United St*ates (1938) in which the court ruled that it was important for public agencies to improve on their hearing procedures to align them with constitutional due process principles. In *Goldberg* v. *Kelly* (1970), the court ruled that officials could not terminate public assistance benefits in an arbitrary fashion. The class action suit involved Kelly, who had been denied benefits provided through the Aid to Families with Dependent Children (AFDC) provisions. The law required that a recipient must receive notice before changes or termination can be implemented.

In *Citizens to Preserve Overton Park, Inc*. v. *Volpe* (1971), the court held that the Secretary for Transportation had exceeded his discretionary authority and that a judicial review of the department's action was in order. The case was about citizens claiming that the Secretary of Transportation made a decision to construct a highway through Overton Park in a manner that violated congressional statutes. Congressional statutes gave the Secretary the authority to do so when "feasible and prudent." The court held that judicial review pursuant to the Administrative Procedure Act (1946) was necessary and that the application of discretion had to be checked.

A case involving the Secretary of Labor and the exercise of administrative discretion in matters of safeguarding the public against industrial pollution further illustrates the technical complexities involved in policymaking discretion. In *Industrial Union Department* v. *American Petroleum Institute* (1980), the court ruled that the Secretary exceeded his authority to set standards. The Secretary of Labor had acted under the authority of the Occupational Safety and Health Act of 1970 to set standards of airborne concentrations of benzene to which employees would be exposed. The court based its reason on the argument that the Secretary has acted without

full knowledge of the new standard's ability to ensure safe and healthful workplace.

Unbridled discretion was at the core of the case *City of Lakewoo*d v. *Plain Dealer Publishing Compan*y (1988). In this case, city ordinance gave the mayor considerable discretion to the point where abuse was possible. Plain Dealer Publishing Company argued that this ordinance gave excessive and unconstitutional powers to deny or grant applications for placement of newsracks on public property. The city ordinance was deemed to be an affront on the First Amendment. The court concluded that the licensing ordinance was invalid since it gave the mayor too much discretion to discriminate against permit seekers based on the content of their publications. Similar First Amendment arguments were expressed in other cases such as *Caren Cronk Thomas and Windy City Hemp Development Board* v. *Chicago Park District* (2002). In this case, the question before the court was whether the municipal park ordinance that required individuals to obtain permits before holding events was consistent with constitutional freedoms. The court unanimously ruled that the First Amendment guarantee did not require the Park District to initiate litigation every time the agency denied a permit for special events.

Perhaps some of the most well-documented cases on uses of administrative discretion are about immigration. Officials in the Department of Homeland Security, much like their counterparts in law enforcement, exercise much discretion in decisions concerning removal and deportation. These two terms are used interchangeably but in technical terms have different connotations. Before enactment of the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, removal referred to two different procedures, deportation for aliens present in the country, and exclusion for those outside the United States. After 1996, these procedures were consolidated, meaning that unauthorized immigrants and legally admitted noncitizens who broke the law were subject to removal on grounds of inadmissibility or deportability.

Laws governing immigration are quite broad and offer much discretion to the various enforcement agencies. For instance, aliens holding permanent residence status who temporarily leave the country voluntarily after unrelinquished domicile of seven consecutive years, and not under an order of deportation, and who return to the United States may be admitted in the discretion of the Attorney General. The administration determines what is or is not "a person of good moral character."

Courts periodically determine that judicial review of administrative action is necessary to confine administrative discretion. In *Soon Bok Yoon* v. *Immigration and Naturalization Service* (1976), Mrs. Soon Bok Yoon, a married citizen of the Republic of Korea, appealed an Immigration and Naturalization Service (INS) deportation order arguing that INS officials abused their discretion. She had overstayed her visitor status and sought to work in the country after going through a labor certification process. The court ruled that decisions to grant visa extensions lie within the discretion of the INS and that the agency had not abuse its authority. A similar ruling was in *Nicholas v. Immigration* and *Naturalization Service* (1979). Petitioner George Bernard Nicholas, a native of the Bahamas, been arrested and convicted of a drug-related offense. He and his wife had two American-born children. INS ordered him deported in 1974, a decision he contested at the Board of Immigration Appeals, seeking discretionary relief from deportation. A subsequent judicial review of the deportation ruling rejected the humanitarian factors expressed in the petition to provide petitioner relief. The courts deferred to the INS, whose operations instructions and manuals have classifications of deportable aliens whose removal could cause different levels of hardships. Thus, those falling in the "nonpriority" classification, like Nicholas, would be subjected to immediate deportation proceedings. Those whose removal would entail considerable hardship, on humanitarian grounds, would be on delayed status. Further, in *Zacharakis* v. *Howerton* (1981), Panagiotis Zacharakis sued Joe Howerton, District Director, Miami, Florida, for improper use of his discretion

by refusing to grant him (petitioner) a stay of deportation. Zacharakis also contended that he should have been offered a "deferred action" status even though INS had already issued an order for deportation against him. The law grants the INS discretion to grant a stay order, but "stays" are a temporary measure and are appropriate for aliens whose substantive claims entitle them to stay in the country. The court rejected the petitioners petition to be included in the "deferred action category" and therefore sustained the administrative decision of the INS.

Other cases show similar patterns of official behavior. A Senate Judiciary Committee hearing in July 2015, chaired by R-Iowa Chuck Grassley, revealed that in some cases sanctuary policies hurt American families. Such politicization of immigration issues painted ICE as often-releasing criminals at the administrations' own discretion. Although many cases are framed in human rights lenses, the legal process tends to strongly defer to administrative authorities in enforcement issues.

## And So, Just How Much Discretion Is Acceptable?

The cases convey that administrative discretion has to be checked, structured, and confined. The possibility of abuse of discretion is precisely the reason for both legislative and judicial oversight, manifest in judicial reviews represented in the cases. When the legislation seeks to constrain agency rule making, it does so based on similar arguments – to protect the rights of citizens. Administrative law, therefore, provides the necessary external check on bureaucratic policy imperatives and permits those affected negatively by administrative action an avenue for redress.

A common observation is that administrators are faced with difficult situations and must use discretion at one point or the other. Even in situations where increased use of programmed decisions and other automated Artificial Intelligence (AI)-enabled devices, supervisors are bound to uphold the highest standards of accountability and responsiveness. As a matter of practicality, practitioners must first figure out whether or not they even have discretion in the first instance. Practitioners cannot just assume they have discretion and must apply ethical decision making.

## Conclusion

Although discretion is required in administrative processes, the challenge lies in ascertaining ways to confine and structure discretion to prevent violation of rights of citizens. From administrative theory perspectives, discretion has to be exercised in public interest and in recognition of the importance of representative bureaucratic norms. Administrative theory emphasizes the importance of accommodation of a variety of interests and the interplay among variables such as administrative neutrality, technical rationality, and constitutional competence. In particular, administrative discretion has to be in tune with "due process" clauses established in the Fifth and Fourteenth Amendments to the Constitution and the Administrative Procedures Act.

## Definitions

**Administrative discretion** Entails the usage of a public officer's own judgment or intuition to make decisions, especially, where the rules, regulations, and procedures appear grey or such usage becomes imperative due to a context-dependent situation.

**Discretion as "Pet"** The nature of services public officials provide calls for human judgment that cannot be programmed and for which machines cannot totally substitute; rules specify the duties and obligations of officials, and discretion allows them freedom of action (Lipsky 1980). Discretion is also required to adequately respond to somewhat novel, unexpected, and unique situations.

**Discretion turns "Monster"** The tendency for public power holders to use discretion in "bad faith"; inability to convincingly justify or account for the use of discretion. Excessive (mis) appropriation and usage of discretion less accountability reduces the efficacy of public administration regulations, procedures, as well as "the spirit and letter" of administrative practices and inimical to development administration.

**Development administration** Advances a need to restructure or reform aspects of public administration processes, practices, and behavior of public officials to empower the administrative machinery to efficiently and effectively carry out policies and actions that improve service delivery and social-economic advancement of countries.

## Introduction

In public administration discourse and practice, there is a recognition [new public management theorists] that public officials should be given some form of discretion in order to promote innovation and managerial flexibility and to prevent them from being "a cog in wheel" in the discharge of their duties (Osborne and Gaebler 1992). The exercise of discretionary powers is also useful in taking context-specific decisions (see Tummers and Bekkers 2013). This is against a backdrop that laws or regulations cannot fully foresee and adequately predict or anticipate all possible and plausible issues and events (see Simon (1947) on bounded rationality bounded rationality); and even if they do, some situations might require completely a different approach and improvisation (Lipsky 1980; Scott 1997). Consequently, the issue of discretionary powers has been the subject of copious and advanced discussions in the literature of public administration. This is also

because a larger degree of the work of public officials involves the exercise of discretion in one way or the other (Lipsky 1980). For instance, the street-level bureaucrats come into direct contact with clients or citizens on routine basis and the decisions they take invariably impact on the nature and quality of service provision (ibid). In addition, the administrators found in public agencies need to translate somewhat vague legislative mandate into actionable goals, consequently the quest for and use of bureaucratic discretion is largely part of the life cycle of public administration. In most cases, the level of discretion largely depends on the tasks organizational members perform. The literature argues that increased formalization of processes and procedures could reduce discretion while the organizational climate could moderate the amount of discretion exercised (Scott 1997).

The managerial flexibility associated with new public management has come with it greater levels of administrative discretion which in most cases has been usurped. Crucial questions remain: to what extent do public power holders use discretion in good faith? And how do they account for their use of discretion? Put differently, although discretionary powers cannot be dealt away with completely, it is widely acknowledged that a large amount of discretion without proper checks, monitoring and accountability mechanisms could make its deployment problematic to service delivery and development administration (Lipsky 1980). The notion of development administration connotes the various processes, procedures, and restructuring by which public administration could become a more appropriate instrument to foster socio-economic growth. It is within the foregoing context that scholars advocate for effective measures to guard against excessive (mis) appropriation and usage of discretion which could reduce the efficacy of public administration regulations, procedures, as well as "the spirit and letter" of administrative practices. The argument is that in spite of the theoretical and empirical arguments for bureaucratic discretion (see Huber and Shipan 2002), it appears that a lot more public officials abuse the systems and procedures to the detriment of utilitarian public interest. The main objective of this study is to discuss the theoretical underpinning of bureaucratic discretion and practical experiences in the public administration of Ghana using some selected cases. In other words, the paper seeks to examine how administrative discretion gets (ab) used in the delivery of public services. A key question underpinning the study is: how does the use of bureaucratic discretion influence development administration in Ghana?

## Conceptualizing Discretion

The concept of discretion is widely used in the literature of Public Administration even though a universally accepted definition is yet to be arrived at. It generally denotes the tendency for public officials to make decisions with their own *intuition, or whims and caprices*. For instance, in the view of Davis (1969), discretionary powers become activated where the effective limits on the public officer's power and authority "leave him [or her] free to make a choice among possible courses of action or inaction" (p. 4). In effect, Davis argues that whenever there appears to be grey areas in the constitution, laws, regulations, standard operating procedures [if they do not succinctly express a course of action or inaction], public officials are then left with the freedom to make decisions among many options they deem fit ideally based on their "best" judgment.

Bureaucratic discretion could be classified into de facto and de jure (see Hvinden 1994). By de facto, officials derive their discretion by taking advantage of some form of vagueness or ambiguity in the letters of procedures, the rules or the regulations, and/or inadequate checks and controls on the public official. Consequently, with the former, public officials allot or arrogate discretion to themselves sans legitimately assigned entitlement. For instance, Lipsky (1980) observed that public employees who interact with citizens behave in ways that are unsanctioned or unauthorized, sometimes even contradicting official policy. This is not to suggest that de facto discretion is necessarily bad, the nature of tasks and dynamics requires some form of discretionary

judgements to adequately respond to unexpected and unique situations (Thor'en 2008). Lipsky (1980) contends that street-level bureaucrats have discretion because the nature of services they provide calls for human judgment that cannot be programmed and for which machines cannot substitute; he maintains that while rules specify the duties and obligations of officials, discretion allows them freedom of action.

With regards to de jure, there is some kind of formal approval to use such discretionary powers where feasible, for instance, to determine a social right or assess needs (Hvinden 1994). With this dimension of discretion, its allotment or conferment is done by policymakers or legal documents relative to standards set by the same authority. For instance, Ghana's Petroleum (Exploration and Production) Act 2016 has a provision that gives the sector Minister the power to even discard competitive bidding results and to use his powers or discretion in the award of oil block contracts to an entity he deems fit.

From the discussion above, this entry provides a working definition of bureaucratic discretion to mean *the usage of a public officer's own judgment or intuition to make decisions especially where the rules, regulations and procedure appears grey or such usage becomes imperative due to a context-dependent situation*. Whether it is de facto or de jure, it is expected that public officials ideally use discretionary powers based on sound judgments and "good faith" towards effective public service delivery to satisfy greater number of persons and national interest (Molander and Grimen 2010).

## Determinants of Bureaucratic Discretion

Certainly there are numerous factors that may influence how discretion is exercised in public organizations. Variables such as the task at hand, the decisional context, workload pressures, an organization's internal culture, rules and constraints, and an organization's external environment are crucial factors. This presents a challenge for researchers trying to identify the most useful determinants that yield explanatory relevance while holding to acceptable levels of theoretical parsimony (Hempel 1966). Because discretion is influenced heavily by the context in which it is exercised, an essential first step involves selection of a specific organizational and/or policy context. One context typically associated with the exercise of discretion is the street-level bureaucracy. As an organizational form, street-level bureaucracies are unique in that they place high levels of reliance on individual service providers to serve as brokers between the organization and its clientele (e.g., Prottas 1979). Street-level bureaucrats are responsible for translating clients into bureaucratically defined categories in order to provide services, treatment, and other forms of assistance. Accordingly, street-level bureaucrats often are imbued with high levels of discretion, despite their low rank (Hasenfeld and English 1974). Street-level bureaucrats use this discretion to manipulate the information about its clients that is available to the organization and to limit the agency's ability to influence their own behavior (Prottas 1979).

Although street-level bureaucracies are found across a broad spectrum of organizations (e.g., hospital emergency rooms, schools, juvenile courts, police departments), several studies have focused specifically on human service agencies and the role of the individual decision maker characteristics in determining how treatment, services, and benefits are provided to clients (e.g., Stone 1981). In one study of a public assistance agency, Kroeger (1975) found that sympathetic case workers tended to provide more benefits to clients than did rule-oriented caseworkers. Other studies highlight the importance of organizational characteristics as potent influences on discretion. For example, Peyrot (1982) noted that decisions about client eligibility generally tend to be tightly circumscribed by organizational routines that limit caseworkers' flexibility. In a study of 116 health and welfare agencies, Aiken and Hage (1966) contend that high levels of formalization served as constraints on caseworker decisions. These constraints served as a source of alienation among professional employees. Kelly (1994) suggests that the values emphasized in an organization's culture influence the structural characteristics that moderate the level and type of discretion exercised. From a proficiency

perspective, these kinds of constraints are important because they enhance accountability; protect clients from the whims and caprices of individual bureaucrats; and reduce the potential for workers to breach the public trust, usurp political authority, and/or interject institutional, group, or individual bias into decision making (Burke 1986). A third, *albeit* mixed, stream of research points to the importance of client attributes in influencing decision outcomes in human service organizations (Stone 1981). According to Goodsell (1981), clients who exhibited greater levels of need tended to receive proportionally greater benefits. By contrast, another study showed that clients who were viewed as more difficult or troublesome received fewer benefits because service providers withheld information, evaded questions, and engaged in other tactics designed to make the application process difficult (Hasenfeld and Steinmetz 1981). Other studies have indicated that more articulate and knowledgeable clients tend to receive proportionately greater benefits, largely because of their ability to generate pressure on agency officials to modify bureaucratic routines to the clients' advantage (Tripi 1984).

Despite the mixture of evidence, all of these studies suggest three broad sets of factors that influence discretion in street-level bureaucracies: characteristics of the client, organizational characteristics, and attributes of the service provider. Hasenfeld and English (1974) allude to these categories by stating "in human service organizations the ...[service provider]..... may face counter pressures from three subsystems – the client, the organization, and the profession, each of which has its own distinct preference of goals and means" (p. 19). Similarly, Prottas (1979) notes that in the process of categorizing the client as a basis for providing assistance, the human service agency, the service provider, and the client all have an interest in how the client is categorized and each strives to influence that decision.

## Methodology

The main object of this entry is to discuss the practice of bureaucratic discretion and to contextualize its manifestation in Ghana's public administration. The entry therefore adopts case study design within qualitative research approach which is deemed more appropriate to explain, describe, and explore phenomenon. The entry made use of theoretical literature on bureaucratic discretion and later contextualized it within the Ghanaian Public Administration. The study largely used secondary sources of data which involved bulletins from the Ministries, Departments, and Agencies, newspaper publications, and online sources which report on possible abuse of bureaucratic discretion. Theoretical literature was obtained from published journal articles and relevant scholarly books. Key search phrases were used to obtain a pool of relevant literature which were sorted out for relevance at several stages. Content analysis was used to synthesize key themes from relevant data sources that that were pooled out.

## Results and Cases

This section discusses the notion and practice of discretion in the context of Ghana's Public Administration and the Constitution. The section begins with an overview of the legal basis for the exercise of discretion as well as the process for exercising administrative discretion within a more accountable framework. This is followed by three empirical cases that depict appearance of "discretionary abuse" which had tendencies for derailing the notion of development administration. Key lessons and policy implications as well as safeguard measures are derived from the discussion and cases.

### Exercise of Discretionary Power Under Ghanaian Law

The fourth Republican Constitution of Ghana provides an inbuilt system, which seeks to regulate the use of discretionary powers. Article 296 of the 1992 Constitution provides that a person or authority in whom discretionary powers are vested shall be required to exercise that power in a fair and candid manner; and not in an arbitrary, capricious, or biased manner actuated by resentment, prejudice, and personal dislike. With the

exception of judges and judicial officers, a person or authority exercising discretionary powers is required to publish a constitutional or statutory instrument showing how such discretionary powers are to be exercised. Similarly the Constitution requires administrative bodies under Article 23 to act fairly and reasonably and comply with the requirements imposed on them by law. Article 23 further provides that a person aggrieved by the exercise of such acts and decisions shall have the right to seek redress before a court or other tribunal. The combined effect of the Constitutional provisions on discretion under the Ghanaian Constitution can be seen as creating a situation of a "stiff discretion" as the basis of the discretion must be scrutinized first.

In the case of Republic v Minister for the Interior; Ex parte Bombelli [1984–86] 1 GLR 204, the court noted that the exercise of discretionary power conferred by statute on an administrative body or executive authority would be subject to the supervision of the High Court to see to it that the power was exercised legally (i.e., within the confines of the law).

### Deployment of Discretion: Appearance of Impropriety and Discretionary Abuse

This subsection presents and discusses three empirical cases that have appearance of discretionary abuse as well as their implications on the administrative machinery in the aftermath. The argument is that public officials are expected to exercise power and discretion in "good faith" to promote utilitarian public interest. The cases presented here raise red flags on abuse of administrative discretion.

**Case 1 Abuse of Police Discretion (New Patriotic Party V Attorney – General)**

Ghana once had a legislation (Public Order Decree, 1972 (NRCD 68), section 7 of which gave the Minister for Interior the power to prohibit the holding of public meetings or processions for a period in a specified area; section 8 provided that the holding of all public processions and meetings and the public celebration of any traditional custom should be subject to the **obtention of prior police permission**; section 12 of NRCD 68 gave a superior police officer the power to stop or disperse such a procession or meeting; and section 13 of NRCD 68 made it an offense to hold such processions, meetings, and public celebrations without such permission.

The plaintiff, New Patriotic Party, a registered political party in Ghana, sought for and was granted a police permit on 3 February 1993 to hold a rally at Sekondi on 6 February 1993. The police, however, subsequently withdrew the permit using their discretion. On 16 February 1993, the plaintiff in conjunction with other political parties embarked on a peaceful demonstration in Accra to protest against the 1993 budget of the government, but the demonstration was broken up by the police and some of the demonstrators were arrested and arraigned before the circuit court on charges of demonstrating without a permit and failing to disperse contrary to sections 8, 12(c) and 13 of NRCD 68.

On 17 February, the plaintiff was granted a permit by the police to hold a rally at Kyebi to commemorate the 28th anniversary of the death of Dr. J B Danquah (a Ghanaian political icon), but the permit was withdrawn and the rally prohibited by the police on the day of the rally. Aggrieved by those decisions and actions of the police, the plaintiff brought an action before the Supreme Court for a declaration that (i) sections 7, 8, 12(a), and 13 of NRCD 68 were inconsistent with and a contravention of the 1992 Constitution, especially the Constitutional provision dealing with the freedom of movement. The plaintiff also argued that under the 1992 Constitution, no permission was required of the police or any other authority for holding of a rally or demonstration or procession or the public

(continued)

celebration of any traditional custom by any person, group, or organization.

The Plaintiff asserted that the police should never be given the right to issue a permit authorizing a meeting, procession, or celebration as it was more than clear that they had abused it on a number of occasions.

The Supreme Court of Ghana agreed with the Plaintiffs. The Court held that the requirement of prior permission had the effect of giving the police the power to determine who had the right to gather and not. This in effect defeated the Constitutional right of the freedom of assembly and association.

**Case 2 Remission of the "Montie 3" Contemnors**

A radio presenter [Salifu Maase] at an Accra-based radio station, "Montie FM," and two of his panelists [all three being members of the NDC party, the then ruling government] on a political show made some threatening pronouncements against the judiciary of Ghana. They appeared to have threatened to kill judges of the Supreme Court if a case brought against the Electoral Commission did not go the way of the ruling government. They also threatened to rape the Chief Justice Georgina Theodora Wood. The three and the directors of Montie FM were hauled before the Supreme Court on the charges of contempt. They pleaded guilty to the charge. The Supreme Court found them guilty of contempt. They were sentenced to serve a jail term of 4 months with fines. The supreme court in imposing the sanction noted, "the attack which was directed at the Chief Justice of Ghana and the apex court of the land, amounts to a criminal contempt of the judiciary." In amplifying the situation, the court noted that it has come to its attention "that reckless attacks on judges of this court in particular and the judiciary in general have become rampant in recent times and appear to be escalating in outrageous temerity."

There were mixed reactions that greeted the sentence, although many analysts welcomed the sentence, others, especially, those aligned to the ruling government criticized as rather too harsh. Consequently, most followers of the NDC including cabinet ministers began signing a petition ostensibly to have the President activate his discretionary powers of mercy under Article 72 of the 1992 Republican Constitution and have the contemnors [party members] freed. The President heeded to the pressures from his party members and got the contemnors released after spending less than 3 weeks in jail instead of 4-month Supreme Court sentence. source: https://www.graphic.com.gh/news/general-news/supreme-court-jail-3-contemnors-4-months-in-imprisonment.html.

**Case 3 Midnight Appointments and Contracts**

The term "midnight appointment" borrowed from American Jurisprudence is linked to the events culminating in the landmark decision of Marbury v Madison. In that case, the American supreme court upheld some last minute appointments made by the outgoing President (John Adams).

In recent times in Ghana, there have been public outcry regarding the question of what

(continued)

a president can do in his last days in office. At least two former Presidents [John Kufour and John Mahama] have in one way or the other been accused of acting in "bad faith" especially in the latter days of their tenure in office. These Presidents after their parties had lost elections and knowing very well that they would be handing over to a new government did carry out major decisions which in principle had the potential of saddling the incoming government with a myriad of obligations and debts (and which the new government would never have incurred in the first place).

Former President Kufour was criticized for a 16–32% increase he approved in salaries for workers in the public and civil service a few hours before leaving office in January 2009. To avoid such last minute tendencies, the Presidential (Transition) Act (Act 845) was passed in 2012. However, in the aftermath of the 2016 Presidential elections, the incumbent President John Mahama who lost to the main opposition leader Nana Akufo-Addo went on a similar path as former John Kufour. Ex-President Mahama, for instance, made at least three major appointments in the dying embers of his administration. He appointed Joseph Whittal as the Chairperson of the Commission on Human Rights and Administrative Justice, a Commission, which had been without a substantive Commissioner for almost a year, following the removal of the previous commissioner, Lauretta Lamptey over allegations of corruption. He also appointed Josephine Nkrumah and Daniel Domelovo as chairperson of the National Commission for Civic Education and Auditor-General, respectively, with less than 3 weeks to hand over power to the New Patriotic Party. Additionally, the Mahama-led government made a 63% increment in the allowance of National Service personnel and signed various contracts without active consultation with the incoming new government which would execute such contracts and the cost thereof. Meanwhile, the incoming government explained that when the transition team was formed, some ground rules were agreed on, which included an agreement to halt all employment and procurement as the then President-elect awaits his swearing-in.

## Discussion

As already established under Ghanaian law, much as the concept of discretion is fluid and may appear as arbitrary; this aspect of the law and public administration is fairly circumscribed by provisions in the Constitution.

In the case of the New Patriotic Party v Inspector-General of Police (Case 1), the focus was on the exercise of discretionary power by both the Minister of Interior and the police. A number of issues relating to the exercise of discretion were raised including, inter alia, (i) whether the discretionary power of the Minister under the legislation in question was a clog on the exercise of freedom of assembly; (ii) whether there was a real likelihood of misuse of discretion by police to suppress fundamental freedoms and civil rights of Ghanaians; and (iii) whether the unfettered discretion of a police or public officer was constitutional.

In all the questions posed, the Supreme Court answered in the affirmative. With respect to the power of the Minister of Interior to grant permission before an assembly takes place, the court noted that "to invest the minister with such unfettered discretion is to place those who assert their constitutional rights of assembly, procession and demonstration at his mercy." The court went on to declare such power unlawful.

In the Montie 3 case (Case 2), the discretionary power of the President to grant pardon for the conviction of certain offenses came into sharp focus. Article 72 of the 1992 Ghanaian Constitution provides that the President acting in consultation with the Council of State may among other things remit the whole or part of a punishment imposed upon a person. The President, acting upon a petition of some of his supporters and on the advice of the Council of State remitted the sentences of the three men.

In the Supreme Court's judgment convicting the three men of contempt of court, the court noted that "they (the contemnors) completely forgot that they were on Planet Earth in a country called Ghana with laws, regulations and customary rules of etiquette and decorum. They were totally reckless and insensitive in their comments having regard to the fact that they were speaking on the eve of the anniversary of the murder of three judges, a very painful and sorrowful period for most patriots of Ghana."

The Supreme Court went on to note "... we realize that reckless attacks on judges of this court in particular and the judiciary in general have become so rampant in recent times and appear to be escalating in outrageousness and temerity."

Against the above background, the decision of the President to grant pardon in this instance was considered as an endorsement of the attack on the judiciary and to that extent was inconsistent with the spirit and purpose of the Constitution. In as much as the President had discretion relying on a constitutional power, it was not a prudent exercise of his discretionary power; and it would seem he suffered for it (including other factors) in the 2016 presidential polls when he campaigned for a second term but got rejected by Ghanaians which has never occurred in the political history of the country. The manner in which the President exercised his discretionary powers can be considered as having undone what the Supreme Court sought to achieve in its judgment (i.e., deterrence).

The question of "midnight appointments" is usually fraught with two competing and yet convincing arguments and counter-arguments. The competing arguments at play involve legal propriety on the one hand and concerns of ethical impropriety on the other hand (See Punay 2010). Under Ghanaian law, the President has the power to exercise any of his executive functions and power until the moment where he hands over power. This means that on the night before handing over power, he is entitled to make certain key decisions and strategic appointments he considers necessary (see also Rhodes 1964). His power to appoint is not limited or hampered by the fact that he may be in his final moments in office as President. Yet the manner and context in which his powers are exercised may raise certain questions regarding ethical impropriety especially at the blindside of the president-elect yet to be sworn who will be required to take responsibility of such last minute contracts and decisions (see also Hobson 2003; Stiglitz 2013). Some may go as far as saying that the exercise of his powers may not even be in consonance with the spirit of the Constitution.

There is no doubt regarding the power of the President as the number one bureaucrat of the land to make appointments and enter into certain agreements and arrangements. However, the wisdom behind these appointments and agreement is questionable, especially, when they have the potential of burdening the incoming government with additional costs and persons it may not necessarily want to work with (Stiglitz 2013). In the Ghanaian case (Case 3, par. 3), expressing their disappointment, the new NPP Administration (new government greeted with midnight appointments and contracts) made clear its intention of reviewing some of these agreements [midnight agreements] since they could have potential of impeding smooth administration and direction with which the government wants to go.

## Conclusions and Policy Implications

From the above discussions, the entry has revealed that although new public management theorists have advanced for much flexibility in the execution of public manager's function, the possible abuse of unfettered flexibility and administrative discretion makes this call shrouded with complexities. While public officials who wield authority are required to use their discretionary

powers to act in ways that maximize public value governance, the cases revealed in this paper have demonstrated that public officials in most cases are tempted to use discretion arbitrarily and for "political convenience." In conclusion, even though bureaucratic discretion has its benefits such as facilitating quicker decision making and taking away the need for excessively detailed guidelines, the possibility of abuse and wrong decisions makes it necessary to institute measures such as improving the capacity of the bureaucrats, making available appeal avenues, involving more people in the decision-making process to ensure that bureaucratic discretion leads to accurate and fair decisions within a framework of accountability and administrative responsibility. Public administration scholars have argued for managerialism which seeks to allow public officials more room to demonstrate innovation and to adopt context-dependent decisions, and the use of discretion in itself is not bad. In order to ensure the appropriate usage of bureaucratic discretion in the proper sense, the entry argues for a systems approach which requires "strong men and women," "strong institutions," and "strong third force" (see Yeboah-Assiamah 2016) which combine synergistically to guard against arbitrary use of administrative discretion.

By strong men and women, the study argues for public officials with positive personalities, and sense of conviction; put differently, true statesmen and women who take decision and actions largely based on collective interest and not for individual or sectional interest. In other words, it calls for individuals with public ethos who do not employ administrative flexibility or discretionary powers to abuse or oppress individuals, groups, and the state. Achieving such an ideal state requires ethical public officials; first of all, there is a need to improve capacity of public officials through training sessions to adequately equip them for their duties. There must also be regular workshops for bureaucrats on how to use their discretion responsibly. Secondly, there should be availability of "appeal avenues" so decisions taken can be revisited and corrected where necessary to serve as a check on administrative discretions.

Secondly, the entry argues for "strong institutions" which requires the appropriation of rules and systems to monitor the use and abuse of bureaucratic discretion and to hold public officials to account for such usage. In Ghana, the rules are explicit regarding how public officials ought to account for their usage of discretion and all possible and plausible de jure discretions need regularized and accounted way of exercising such with the exception of those wielded by Judges. However, public officials who capitalize on institutional grey areas, institutional laxities, and perhaps ignorance of citizenry mostly usurp the threshold of their powers without accounting for their use of such powers. It is, therefore, prudent for public agencies, departments, and ministries to adopt a directive to streamline how their officers use and account for discretionary decisions, and in situation where the scope of a decision may engender far reaching consequence, approval must be sought from other relevant authorities. This is not to suggest a reverse to traditional bureaucratic thinking where public officials were viewed as cog in wheel but to promote efficiency, effectiveness, and efficacy in a more accountable manner devoid of few people exploiting public trust and resources. This requires expanding the public decision-making space to counter the possibilities for abuse of discretion.

Finally, the study argues for an active "third force" which is conceptualized to mean the integrated watchdog and supervisory efforts of non-state actors such as the media, think tanks, opposition parties, interest groups, religious groups, traditional institutions, all other civil society organizations, and general citizenry. The combined efforts of the third force will serve as a formidable check on how public officials exercise their powers and discretion. For instance, civil society organizations could sensitize the public on their rights and responsibilities as well as powers, obligations, and limitations of public officials. In most cases, although there are regulations and institutions that guard against the arbitrary use of public power, ignorance on the part of many citizens and groups render them largely susceptible to the whims and caprices of bureaucratic power holders. For instance, police officials in most

cases tend to abuse their powers when they come face to face with motorists in an attempt to extort moneys from the latter. There is therefore a need for public sensitization and massive education to keep citizens well informed.

# Administrative Discretion in Participatory Processes

Roberto Falanga
Sociology, Instituto de Ciências Sociais,
Universidade de Lisboa,
Lisbon, Portugal

## Synonyms

Bureaucracy; Discretionary power; Institutionalization; New governance; New public management; Public administration; Public officials; Public participation; Public policymaking

## Definition

Administrative discretion in participatory processes refers to the degrees of power exerted by public officials at the margins of formal roles. As participatory processes in policymaking require public officials to intermediate between political representatives and social agents, administrative discretion is a key feature for the (re)configuration of public officials' roles in public administration.

## Introduction

Weber's theoretical model of bureaucracy provided an ideal type of organization for the management of democratic governance in the nineteenth century. The author identifies formal rules and procedures and argues the adoption of impersonal behavior by public officials in order to ensure a clear-cut separation between personal and organizational interests. The autonomy of bureaucracies was supposed to secure stability and continuity of democratic governance against the discontinuity of political cycles. More recently, scholarly debate has focused on bureaucracy as the organizational and normative structure that sustains democratic governance, and upon which public officials can develop full-time and lifelong careers. Ethical codes of behavior concerning duties and rights of the civil service provided by bureaucracies should secure the fair relationship between governors and those they govern against arbitrary practices in policymaking.

The Weberian ideal type of bureaucracy has been debated by scholars, who have problematized its potentials and limitations. While acknowledging the need for hierarchical distribution of roles in policymaking, the "black box" comprising decision-making has increasingly required further discussion upon matches and mismatches between different levels of political powers, as well as between administrators and political representatives. In addition, the role of external environmental pressures is recognized as a source of potential conflict with the preservation of stable boundaries and roles. Acknowledging both internal and external limitations, Selznick (1957) questions the effectiveness of approaching civil service according to merely formal rules, which may rather lead towards forms of "incapacity" of adaption to changing environments. The acknowledgment that public officials relate to each other according to formal rules and beyond has made Gouldner (1959) state that discipline-driven and impersonal rules are likely to reduce the commitment of public officials and, thus, the accomplishment of public administration's goals. This position echoes Merton's argument (1938) upon the "professionalized incapacity" of public officials to exert their functions and the increased difficulty in adapting to environmental changes, as the most probable outcome of Weberian bureaucracy.

While the ways through which public administrations are formally ruled and organized matters, the behavior of administrators, and the development of relationships out of the rigid grids of formal codes requires critical understanding. Multiple schools of thought and administrative reforms in the twentieth century have diversely captured the opportunity to reconfigure the formal division between elected and public officials. During the 1980s and 1990s, the "new public management" school of thought put emphasis on the need for highly professionalized top-level managers in public administration, who were required to ensure loyalty to elected officials (Osborne and Gaebler 1992). Professionalization and political loyalty were argued to radically transform the legally based neutral status of public officials, and the relationship among top-, middle-, and street-level public officials.

New public management-led reforms in public administration aimed at intervening in the enduring struggle, as Weber himself acknowledged, of political and technical expertise in public administration. More recently, scholars have recognized that new public management reforms do not adequately respond to the emerging complexity of different forms of expertise from within and outside public administration, which have considerable influence over effective policymaking. According to Page (2007), not only top-level bureaucrats but all levels of official hold

responsibilities that expose them to potential alignments and conflicts with elected officials. The establishment of new networks and partnerships between governmental and non-governmental agencies and the growth of new connections with associated and nonassociated citizens in participatory processes raise questions about current boundaries of political and administrative powers.

The "new governance" school of thought has shed light on the political output as part of a wider process of negotiation and bargaining with economic and social agents (Rhodes 1996). Against the emphasis on mere instrumental rationality underlying policy agents, there has been broad agreement on the need to render policymaking more open to and adequate for targeted public agents. However, without the reconfiguration of public officials' expertise and roles, from top to street levels, misperceptions and misunderstandings among the agents engaged in decision-making may become a major hurdle for the success of participatory processes. More pointedly, the potential conflict emerging between standard bureaucracies and participatory processes requires deeper understanding on the ways public officials contribute to their management within and beyond formal roles.

## Understanding the Roles of Public Officials in Participatory Processes

Scientific literature on the participation of both associated and nonassociated citizens in policymaking processes is longstanding and abundant. The growth of participatory processes worldwide confirms a great diversity of sociopolitical contexts, publics, and policy issues covered by these processes. Furthermore, the adoption of a wide variety of methods, mechanisms, and techniques, such as public hearings, citizen juries, advisory committees, consensus conferences, ballot initiatives, and the like, corroborates the growing importance of this field of study and practice (Gaventa and Barret 2010).

The management of citizen participation proves that standard bureaucracy and recent administrative reforms set up on managerial values are likely to clash with changes brought about by participatory processes in public administration (Vigoda 2002). Public administration is the battleground where the design for effective citizen participation in policymaking is conducted, and public officials play a key role in either improving or hindering the execution of participatory processes. As already stated in the 1970s, and confirmed by recent research on the topic, the participation of citizens in policymaking ultimately depends on the type of administrative commitment.

To understand the influence of public officials over the management of effective participatory processes, there is a need to define their formal roles. The wide variability of institutionalization of participatory processes, however, makes this question difficult to answer. Participatory processes can either depend on legal requirements that enforce administrative structures to adopt formal procedures or rely on temporary covenants issued by elected officials (Fung 2015). More often than not, participatory processes are implemented as one-off initiatives to complement standard policymaking, with little guarantee of their continuity in the long run. As stated by Rosenbaum (1976), low enforcement levels may stem from either governmental reluctance, which renders participation politically unrewarding, or administrative resistance against potential public dissensus, which could delay policy implementation.

Varying degrees of institutionalization of participatory processes and institutional designs provide information about the ways in which participatory processes and public officials are placed within the organizational chart, which reflects, to some extent, the ways citizen participation is embraced within the political agenda. Different degrees of institutionalization can have a marked impact on the rulemaking of participation and, therefore, on the definition of the roles of public officials. The variability of institutional designs adopted by participatory processes contributes an additional level of complexity to the understanding of public officials' roles. While, in some cases, participatory processes are

managed by administrative networks of departments (or single officials), in other cases, administrative units are created for the exclusive attainment of citizen participation goals, with officials dedicated to the management of participatory processes.

Against this backdrop, scholars are divided over the opportunity to institutionalize participatory processes. According to some thinkers, institutionalizing participatory processes could end up "normalizing" spontaneous practices of civil society and reduce their inner variability. In contrast, Hoppe (2011) argues that "[i]n systems of representative democracy, authorities that initiate deliberative experiments on an ad-hoc basis, but fail to institutionalize relations between deliberative procedures, representative bodies and their normal processes of decision-making, do indeed deserve suspicion." (ibid., 180). The lack of institutionalization may lead to "tick-box" exercises of participatory democracy with narrow scopes of political debate, which is rather transformed into one of mere policy implementation.

## At the Margins of Formal Rules: Administrative Discretion in Participatory Processes

Scholarly debate on the institutionalization of participatory processes does not provide an adequate understanding of the actual functions played by public officials in participatory processes. While the definition of boundaries for policy action helps acknowledge which formal requirements are made by the government to the daily commitment of public officials, the interaction with multiple agents cannot help but open new doors and increase degrees of administrative discretion. Despite efforts for institutionalized rule-making, policy processes inevitably maintain degrees of discretion, because there is always a gap between the issuing of normative frameworks and the actual behavior in public administrations. Likewise, reforming public administrations to institutionalize participatory processes may lead to organizational inertia or even reluctance (Thompson 1995).

Considering that the (re)configuration of the roles of public officials provides information about the boundaries of their action in participatory processes, degrees of discretionary power can be exerted at the margins of formal rules. Lipsky (1980) acknowledges that discretionary power is exerted by street-level bureaucrats whenever problems cannot be reduced to programmatic formats, as well as whenever employees have to make some judgment about people for the application of policies. This power is further nurtured by citizens whenever they believe (and are led to believe) that officials are likely to hold the "key" to their well-being. Consequently, discretionary adjustment of their work to the advantage of their own goals or in favor of citizen interests is likely to lead to diminished transparency of public action.

According to Theodoulou and Kofinis (2004), administrative discretion depends on the enlargement of interpretability of policy goals stemming from little clarity in current policymaking. However, the authors (ibid.) also acknowledge that discretionary power can be of help whenever long-term changes in political and administrative environments are needed. In fact, there is always the potential for public officials to counteract the intentions of elected officials, sometimes accidentally when the legislative process itself is contradictory and there is need for the agency to make sense of the mishmash. In this vein, Lipsky's notion of discretion has been questioned in light of more recent participatory processes. The need to interact with local agents and grasp lay knowledge often provides public officials, and especially street-level bureaucrats, with the exclusive opportunity to improve service delivery at the margins of formal roles. The need to make local knowledge useful for effective policy outputs led Thomas (1995) to propose a ladder, describing degrees of power held by public officials, that goes from autonomous decision-making to broad consultation with the public. However, Rosenbaum (1976) cautions on risks of spurious legitimacy of administrative practices that do not improve disadvantaged groups, which leads to an "abuse" of discretion, and moves beyond paradox to a parody of reform.

Against this backdrop, while there is a view that public officials can be a major hurdle to

democratic policymaking whenever moved by personal strategies, and discretionary power is considered a "bias" originating from the failure of formal rules, other scholars view positive contributions from power exerted in the interaction with the public of policymaking. Administrative discretion can be approached as either threatening the formal configuration of administrative roles and functions or as the opportunity to create new connections in the field with social agents. In both cases, more empirical knowledge is needed to broaden the debate on the administrative discretion deployed by public officials at top-, middle-, and street-level.

## Conclusion

Participatory processes challenge standard bureaucracies and previous administrative reforms with new opportunities to reconfigure the roles of public officials. Scholarly debate has focused on administrative discretion by shedding light on the negative and positive sides of it for participatory policymaking. On the one hand, administrative discretion may reproduce biases of unequal distribution of power among sectors of civil society. Out of a transparent definition of principles, mechanisms, and goals of citizen participation, arrangements for social inclusion may rely on nonbinding covenants which have considerable impact on the legitimization of the public agents invited to participate. This type of administrative discretion provides political input over policy processes that are disguised as technical decisions. On the other hand, administrative discretion is a necessary tool for participatory processes inasmuch as it allows for the grasping local knowledge and expertise for effective service delivery. Public officials, from top to street levels, are acknowledged as the gatekeepers for transparent and accountable participatory processes.

While empirical knowledge has been shared on discretionary powers of street-level bureaucrats, however, further research should help to shed light on the ways public officials at all levels contribute to participatory processes at the margins of their formal roles. Towards this aim, it is necessary to take into account the diverse degrees of institutionalization that sustain the different institutional designs of participatory processes, which define formal roles and boundaries required for public officials.

## Administrative Discretion on Taxation

Fany Inasius
Department of Accounting, Faculty of Economics and Communication, Bina Nusantara University (BINUS University), West Jakarta, Indonesia

### Synonyms

Administrative discretion on taxation compliance; Administrative expediency on tax obedience; Administrative policy on taxation compliance

### Definition

An administrative discretion on taxation is a governmental policy related to tax that affects both microeconomic and macroeconomic aspects. The macroeconomic aspects involve the overall quantity of taxes to collect, which can inversely affect the level of economic activity. The microeconomic aspects concern issues of who should be taxed.

### Introduction

A good tax policy is worthwhile if it is implemented consistently, as it can have a positive impact on tax compliance. *Tax compliance* has various definitions. Alm (1991) defines it as the accurate reporting of income and claiming of expenses in accordance with the stipulated tax laws. Kirchler (2007) uses a simpler definition, in which *tax compliance* is the most neutral term describing a taxpayer's willingness to pay tax, while the OECD (2016) defines it as the degree to which a taxpayer complies (or fails to comply) with the tax rules of his or her country, for example, by declaring his or her income, filing returns, and paying tax in a timely manner. Based on the above definitions, it can be concluded that tax compliance is the sincerity to which a taxpayer reports his or her income, files returns, and pays all of his or her taxes on time.

In general, tax compliance involves two main factors: economic factors and noneconomic factors. Economic factors include tax rates, the probability of being audited, and perceptions of government spending, while noneconomic factors include perceptions of equity and fairness, referral groups, and tax knowledge. In addition, taxpayers can generally be divided into two groups: individual taxpayers and corporate taxpayers. Moreover, the economic capacity of taxpayers can be divided into two groups: small medium enterprise (SME) taxpayers and large enterprise taxpayers.

A standard international definition of *SMEs* does not exist (OECD 2017). In Indonesia, the SME Act of 2008 measures an SME based on its turnover. A micro-company's turnover does not exceed IDR 300 million, a small company's turnover does not exceed IDR 2.5 billion, and a medium-sized company's turnover does not exceed IDR 50 billion. A large enterprise's turnover exceeds IDR 50 billion (Inasius 2015). Therefore, SME taxpayers include individual taxpayers and small corporate taxpayers in relation to the sales turnover.

Due to their economic capabilities, SMEs contribute significantly to the national economy (OECD 2017). A study of the tax compliance of SMEs is important, as determining the factors that affect the compliance level of SME taxpayers can assist tax authorities in formulating administrative policies that can improve tax compliance based on the business size.

## SMEs in Indonesia

SMEs in Indonesia, as in many countries, play a significant role in the national economy. This is indicated by SMEs' contribution to approximately 60% of the total gross domestic product; further, SMEs contained approximately 97% of the total work force in Indonesia in 2012 (Ministry of SME Indonesia 2012). However, the contribution of SMEs to tax revenue is lower than that of large corporate taxpayers, who are the biggest contributors to Indonesian tax revenue.

There are several reasons why SMEs' contributions have not been maximized to secure the national economy particularly in tax revenues. First, SMEs have limitations in terms of their administrations. Complex administrative burdens make it difficult for SMEs to fulfill their tax obligations. Second, high tax rates have an effect on tax payment ability, as SMEs are financially limited compared to non-SMEs. Third, the influence of referent groups, including family members and business associates, affects SMEs' contribution level to tax compliance. Fourth, a sense of justice is present in the existing tax rules. Feeling as though they are being treated unfairly discourages taxpayers and decreases their level of confidence in tax authorities. Fifth, the inappropriate use of government funds decreases taxpayers' desire to pay taxes properly due to their disappointment with the use of funds. Sixth, the possibility of being audited contributes to the fulfillment of tax obligations present in SMEs. Being less likely to be audited by tax authorities could encourage taxpayers to be less prudent in completing their tax returns.

## Taxation System

Indonesia, with a population of around 255 million people (Biro Pusat Statistik 2016), is the fourth largest country in the world and has the 16th biggest economy in the world (World Bank 2017). A self-assessment taxation system has been implemented in Indonesia since 1983. There are two main tax types for taxpayers in Indonesia: income tax and value-added tax (VAT). With regard to income tax, the tax rate for individual taxpayers ranges from 5% to 30% depending on their income, while the tax rate for companies is 25%. In terms of VAT, the tax rate is 10% of the net sales turnover, both for individual and corporate taxpayers. This rate is also applied to both SME and large enterprise taxpayers. Therefore, tax compliance has always been an area of concern for tax policymakers, as noncompliance with tax reporting negatively affects revenue collection.

## Methodology and Discussion

To formulate an effective administrative policy for SMEs, it is necessary to determine the factors that significantly affect tax compliance. To determine the factors that influence SME tax compliance, it was necessary to test both individual and corporate taxpayers with turnovers ranging from IDR 600 million to IDR 4.8 billion (around $352,000 USD based on the exchange rate at the time of the study). A survey performed by 55 students was conducted in Jakarta, which is the center of the Indonesian economy with the largest percentage of tax revenue, from November 2015 to January 2016. Five areas were included: Central Jakarta, West Jakarta, North Jakarta, East Jakarta, and South Jakarta. Of the 1000 questionnaires distributed to small retailers, 330 returned responses; two were unusable responses.

The study used multiple regression to identify the factors that affect SME tax compliance. Multiple regression provides a way to objectively assess the relationships between independent and dependent variables (Sekaran and Bougie 2011). Here, the dependent variable is tax compliance, and there are six independent variables: tax rate perceptions, referral group influence, audit probability, tax knowledge, government spending perceptions, and equity and fairness perceptions.

## Tax Compliance

Several factors affect the tax compliance of SMEs in Indonesia. The first is the referral group. SMEs are influenced by tax knowledge limitations, so information obtained from colleagues or family members to evade or not evade taxes is quickly absorbed. The influence of referent groups is seemingly important in decision-making, particularly in decision-making related to monetary aspects and tax compliance. The second is the possibility of an audit. The subjective perception of audit probability is important; less intense audits could cause taxpayers to be less prudent in completing their tax returns. The third is taxpayer perceptions of equity and fairness. Unfair treatment of the authority related to taxation leads to taxpayers' dissatisfaction, which has implications pertaining to their willingness to pay taxes. Tax compliance is less likely if the tax system is perceived to be unfair. The fourth is tax knowledge. The level of education of taxpayers is an important factor that contributes to their general understanding of taxation. In general, SMEs have administrative limitations; therefore, more complex tax rules would complicate their ability to meet tax obligations. Conversely, simpler tax regulations would facilitate the understanding of taxpayers, thus improving tax compliance.

## Tax Administration Policy

Based on the multiple regression, the results show that four variables influence tax compliance: referral group influence, audit probability, tax knowledge, and equity and fairness perceptions. Referral group influence is the most significant variable among the four factors.

Tax rate perceptions do not significantly affect tax compliance. Thus, an increase or decrease in tax rates within acceptable limits may not have a significant effect on taxpayer compliance. A high tax rate could be seen as taxpayers' contributions to the community, which generates benefits for each taxpayer. However, this may be considered unfair to taxpayers when their trust to the authority is low. Therefore, administrative policies cannot consider tax rate perceptions alone. Decreasing the tax rate within acceptable limit without maintaining trust is unlikely to improve tax compliance.

Government spending perceptions also do not significantly affect tax compliance. Tax authorities should focus on how to allocate funds to raise the trust of taxpayers. Hence, using these funds to benefit taxpayers can further increase their trust. Accordingly, government spending that can build taxpayers' trust is useful to ensure tax compliance. However, low trust may be the cause of the taxpayers' indifference toward the use of funds by the government.

In contrast, referral group influence has a significant effect on taxpayer compliance. Family members and colleagues give immediate and direct information that influences taxpayers' decisions regarding tax compliance. Taxpayers are assumed to internalize social norms and act in accordance with their respective references group. Therefore, administrative policies that improve taxpayer trust will ensure taxpayers' compliance.

The perception of equity and fairness has a significant relationship with tax compliance. This indicates that unfair tax contributes tax compliance. If tax burden of taxpayers is comparatively heavier than others, tax compliance is likely to decrease. Therefore, tax policy that supports a sense of fairness based on trust-building measures that may be required and more useful.

However, nontransparent and unfair audits could encourage taxpayers to be less compliant in reporting their income and tax returns, and dissatisfaction reduces their trust in tax authorities. This, in turn, could lead to tax evasion. Thus, audit probability also affects tax compliance. The frequency and thoroughness of audits could encourage taxpayers to be more prudent in reporting their incomes and claiming correct deductions to ascertain their tax liability. Infrequent and informal tax audits may create doubts regarding the effectiveness of tax authorities' work and reduce taxpayers' trust. Therefore, audits should be designed to be fair, whereas

intrusive audits should be avoided. Accordingly, audit policies should be designed with the synergic atmosphere between taxpayers and tax authorities in mind. This can be done with audit policies that support fairness based on trust building between taxpayers and tax authorities.

Tax knowledge also affects tax compliance, wherein greater tax knowledge increases tax compliance. Understanding tax regulations can lead to a sense of participation in paying taxes. Conversely, a lack of understanding of taxation can increase the cost of taxation and the time required to file taxes. Practical tax knowledge can also contribute to tax compliance. For example, knowing the tax officers have conducted a large number of tax audits can make them appear powerful. Therefore, simplifying tax laws, improving taxpayer attitudes toward the complexity of tax systems, and increasing taxpayer services are likely to enhance taxpayers' trust in authorities.

## Conclusion

Based on the investigation of the factors that influence tax compliance using multiple regression, the results show that four variables significantly influence tax compliance: referral group influence, audit probability, tax knowledge, and equity and fairness perceptions. Referral group influence is the main factor that affects tax compliance. Greater tax knowledge and a fair tax system contribute to taxpayers' behaviors and affect each taxpayer. High audit probability may also encourage taxpayers to be more compliant.

Policymakers who are concerned with SME tax compliance can use this study to formulate future tax policies. Accordingly, this study could assist governments when considering the goals and implementation of tax reforms to ensure effective administration, especially in emerging economies. A transparent system not only increases taxpayers' trust but also facilitates taxpayers' understanding of tax, both of which increase tax compliance. Tax authorities should attempt to simplify tax regulations and public services. Reducing the complexity of taxes and increasing the transparency of decision-making by tax authorities could increase taxpayers' trust in tax authorities.

Existing regulations must be implemented fairly and under the full rigor of the law. Committed taxpayers must be supported, while tax evaders should be strictly prosecuted. Therefore, an administrative policy is needed to create a synergic atmosphere between taxpayers and tax authorities and to build a trusting relationship between them. Administrative policies that support a sense of fairness and that are based on trust-building measures may be more effective and less expensive.

# Administrative Efficiency and Policy Failure: The National Health Insurance Scheme of Ghana in Perspective

Francis Nangbeviel Sanyare and Justine Guguneni Tuolong
Department of Social Political and Historical Studies (SPHS), Faculty of Integrated Development Studies (FIDS), University for Development Studies, Wa, Ghana

## Synonyms

Efficiency – efficacy; Quality of care – Service quality or quality of service; Welfare

## Definition

The National Health Insurance Scheme: The National Health Insurance Scheme is a social health insurance scheme to protect the insured against social risk – i.e., ill-health.
Efficacy: Inputs (either financial, structural, or infrastructural) provided by governments or stakeholders to derive quality of healthcare for the insured.
Wellbeing: Healthcare services delivered by providers to ensure that people have good health condition and working in safety.

## Introduction

Globally, as countries move toward universal health coverage, healthcare financing through social health insurance is a very important tool in achieving the guaranteed universal financial protection that meets the health needs of populations, especially in developing countries. Thus, healthcare financing has become the crux of ongoing discourse on global development policy for social protection especially situated in the context of social insurance. In Ghana, health care financing is perceived have made significant gains after few years that is since 2003 of implementation and yet there remain obvious gulfs to achieving its full potential remains prominent.

Empirically, it is suggested that social protection schemes are essential props to any polity's efforts at providing access to necessary social services and transfers (Norton et al. 2001). This is testimony to why Ghana developed its National Social Protection Strategy (NSPS) to provide more targeted sets of interventions for the chronically poor and to cushion the most vulnerable groups from environmental, health, and economic shocks. Arguably, many countries across the world have taken initiatives to establish and practice social health insurance policies, just like the case of the Ghana National Health Insurance Scheme (NHIS). Justifiably, this kind of social protection scheme, among many things, tackles multiple dimensions of poverty and deprivation.

However, perspectives are that financing health care has remained a formidable challenge for most developing countries (Konrad Adenauer Foundation 1999). Yet there is no doubts that health is a pre-requisite for development. Not surprisingly therefore, governments – Ghana inclusive – have a primary responsibility to ensure the health of its nation, which presuppose that, seeking alternatives to financing healthcare is a step in the right direction.

Since independence in 1957, Ghana has gone through series of healthcare financing reforms including the introduction of user fee in the late 1980s; and the Community-Based Health Insurance Schemes (CBHIS) in the early 1990s, which formally led to the National health Insurance of Ghana. It must be noted that foregoing governments strived to ensure that basic health care is available to all at affordable prices and is equitable because good health is both a cause and consequence of economic success. Thus, this is the central reason why the government of Ghana is committed to improving the health of its people regardless of age, sex, ethnic origin, religion, political beliefs or socio-economic standing. However, anecdotal evidence suggests that the situation faced by NHIS in Ghana is appalling as many accredited health care providers have voted out of the system, making insured persons unsure

of their faith. This has led to considerable deterioration of the scheme and making insured persons worst off. This chapter sought to contribute empirically to the efficacy of the National Health Insurance Scheme (NHIS) and assess whether there are administrative failures.

## Overview of Literature and Theoretical Perspectives

It is indisputable to say good health is a necessity to every living soul. And to guarantee this, there is a requirement for explicit measures to tackle health policy deficiencies in every society. Governments across the globe are compelled to find an appropriate health reform policy to arrest ill-health among its populace especially the poor or vulnerable. For this reason, healthcare financing continues to gain an overarching attention in health policy reform discourse across the globe, though no promising health financing reform has been succinct to tackle cost-effectiveness of healthcare delivery; it is hitherto found that user fee and CBHIS health financing system created barriers for the poor to access universal healthcare and hindered equity in healthcare for all (McPake et al. 2011). To restrain this, the National Health Insurance Schemes was introduced to bridge the gaps created in the earlier health financing systems of Ghana (Addae-Korankye 2013).

Considerably, those who researched earlier in the field identified issues that include poor quality of service delivery (Fatawu et al. 2014) and that the NHIS policy is inequitable but advantageous toward the rich than the poor (Oxfam International 2011). However, the main objective of NHIS is to promote cost and risk-sharing in a pool through compulsory insurance premium contributions and ensuring equity in healthcare delivery. This is to improve the wellbeing of the insured since health and wellbeing are interdependent. In most cases however, the evidence suggests that though strides have been made, these objectives, in most cases, are far from been achieved (Akazili et al. 2014).

The World Bank (1992, p. 32) argued that inefficiencies exist in health insurance policies because "low fees does nothing to discourage excess demand for high cost hospital care." As a result, "some of the potential efficiency gains of user fees are forfeited," in health insurance schemes. Hence, it is argued that health insurance schemes place higher burden on the poor and generate low revenue for government to cater for increasing health expenditure which user's fee does not (Lagarde and Palmer 2006). However, it is also argued that full-cost fees cannot be introduced until large parts of the population participate in some form of risk-sharing (World Bank 1992). It is therefore not surprising that Ghana's NHIS is facing problems despite the smooth implementation (2005–2008) and thereafter.

## Ghana's Experience With National Health Insurance

The Ghana NHIS took its cue from the UNICEF CBHIS which started in Nkoranza by the Catholic Mission. Through pilot studies by the government in four districts, the results compelled the enactment of the NHIS law in 2003; Act 650; act amended 2012 (Act 852). The NHIS started as a District Mutual Health Insurance Scheme (DMHIS) in 2003 and was fully implemented in 2005. In 2010 it transited from the DMHIS into a full NHIS coverage where health care could be sought for at any part of the country irrespective of the place of subscription to healthcare (NHIA 2010).

Enough evidence suggests that since the ingenuity of NHIS in Ghana, the scheme has been faced with numerous challenges regarding its quality of service to the insured, making its success a standing block on the one hand (Boateng and Awunyor-Vitor 2013). On the other stand, studies by Seddoh et al. (2011) showed that earlier (2005–2008) the policy made an appreciable benefits to include comprehensive level of care and treatment available for those who held valid NHIS membership cards and they were able to access services as compared to the noninsured.

But after 2010, studies came to contradict the earlier gains as Oxfam International (2011, p. 7) argues that the NHIS health system in Ghana is

unfair and inefficient. It was underscored that the coverage of the NHIS has been hugely exaggerated and could be as low as 18%. Stressing that despite every Ghanaian citizen paying for the NHIS through the National Health Insurance Levy (NHIL), Value Added Tax (VAT), unfortunately as many as 82% remain excluded. Therefore, concluding on the theory of equity, the NHIS is far from reaching its goal as "twice as many rich people (64%) are signed up to the NHIS than the poor people (29%)." These reiterate the inefficiency in the system.

Similarly, studies by Dalinjong and Laar (2012) showed that the NHIS presents huge waiting time of insured patients at hospital giving low quality treatment as compared to the uninsured. This was because of perceived opportunistic behavior of the insured who was responsible for the difference in the behavior of providers favoring the uninsured. Besides, delay in reimbursement by government was also underscored. These delays compelled providers to often prescribe drugs for patience to buy out of their pocket which fail to fully protect the insured financially. This means, those insured are less privileged to maximize their wellbeing as social insurance seeks to offer a social protection mechanism.

Notwithstanding, studies by Atinga (2011) and Fenny et al. (2014) however, reiterate that there were relatively no treatment gaps between the insured and the uninsured in terms of quality of service. This is because findings proved that insured patients obtained satisfactory quality of service. Besides, it was discovered that waiting time was generally perceived to be long, rather argued that, "waiting time alone" is not in any way associated with patient perception of quality of care.

However, Boateng and Awunyor-Vitor (2013), confirmed again that, 23.9% of insured persons had not renewed their insurance after enrollment and 15% had never enrolled. Reasons cited for non-renewal include poor service quality (58%), lack of money (49%) and taste of other sources of care (23%). Similarly, studies by Fatawu et al. (2014) indicates quality of service perceptions (20%) against expectations (80%) of the insured patients interviewed in the Wa Municipality of Ghana. This again presents a huge gap (60%) in quality of service regards NHIS healthcare delivery.

The foretold findings presents invariably differences of thought and largely encapsulates the daily experiences of the poor as they encounter the limitations that policy failure by government and authorities placed on them (Carrin 2002). Consequently, easily translates into emotional torments, as the poor are faced with uncomfortable opportunity costs. But one may ask, what accounted for those differences? And is the NHIS efficient to meet its role and purpose? These are questions which engaged the attention of this chapter.

## Measuring Efficacy or Efficiency in Policy Perspective

Efficiency is an input phenomenon which results in an output effectiveness. It is argued that, the rising cost of health care and inefficiency in policy implementation present in health insurance policies are perhaps the most significant threat to the long-term economic security of every nation. To achieving this, governments need to restrain the unsustainable growth in health care costs. Because, perspectives are that *"health care costs place a large and growing burden on today's . . . and they are projected to continue to grow faster than incomes"* (Social Security Advisory Board 2009, p. 19).

Thus, there have been insurgent debates on how to achieve effective health care reform and restrain the growth in costs, with attention focused on restructuring the payment processes (World Bank 2013). Herein, it is argued that, in order to reform the healthcare system of Ghana while at the same time reducing the growth of health care costs, without reducing quality, there is the need to improve the efficacy and efficiency of the healthcare delivery system (World Bank 1992; Hsiao and Shaw 2007). This means, there is the need for directly improving the efficiency of health care delivery or aligning financial incentives to reward more effective and efficient care

(WHO 2005) (i.e. the two approaches are complementary). Because, incentives are needed to control behavior, improve processes and change organizational culture (Masango et al. 2012).

Therefore, suggested mechanisms to measure and improve efficacy and efficiency in health care delivery systems include: process improvement regards quality, organized systems of care, coordination of care, diagnosis and treatment tools (e.g. new medical devices, well-established drugs and treatment protocols), informed patients choice and shared decision making, emphasis on wellbeing or welfare, health information technology and ultimately aligning financial incentives to reward more effectively and efficient care through value chain rather than volume chain (SSAB 2009, pp. 19–29).

On the other hand, Nies et al. (2010) also relate efficacy and efficiency to match quality assurance. It is put forward that four measurable indicators for efficacy or efficiency are eminent: *System efficiency, Organizational efficiency, Professional efficiency, and User efficiency*. This cuts into the broad spectrum of SSAB's assertions of policy efficiency. Therefore, it is suggested that, for the NHIS to be efficient, the National Health Insurance Authority (NHIA), healthcare providers, the insured and all other stakeholders who have a purpose of contributing to the healthcare of the Ghanaian population must work in consonance through the interlinked variables as put forward in Fig. 1:

In Fig. 1, it is projected that, to assess and improve on efficacy and efficiency to match quality assurance, the NHIS need to be measured on four variable:

- "*System level*. Through legislation, inspectorate, accreditation and certification and national standards and guidelines.
- *Organizational level*. Through quality management systems and audit, benchmarking, monitoring, and performance indicators, and improvement measures and processes.
- *Professional level*. Through Professional profiles/new professionals/new roles, Improvement structures, Accreditation, registration, Communication and information sharing.
- *User level*. Through Informed consent and shared decision making Choice, Client satisfaction, Information and Role of informal and non-formal care."

It is suggest that, these variables are interlinked between efficiency and effectiveness of the NHIS to deliver quality of service to the insured which institutions, and resources need to work in consonance as a system. Because, policy efficiency has variety between levels and each has extensive instruments to be measured on. Therefore, it is argued that in order to maximize the wellbeing of the insured, there is the concern of choices in managing efficiency and different approaches needs to be interspersed to incentivize all stakeholders towards continuous improvement. This is particularly necessary when it comes to the links and interfaces within and between health and social care.

**Administrative Efficiency and Policy Failure: The National Health Insurance Scheme of Ghana in Perspective, Fig. 1** How to make efficiency work for the NHIS: a conceptual model for the NHIA

## How the National Health Insurance Scheme in Ghana Achieved Efficiency: Evidence From the Wa Municipality

As many foregoing literature have underscored inefficiency in health insurance schemes as practiced, Table 1, herein presents a comparative efficiency result among the Wa Municipal Health Insurance Authority (Wa MHIA), healthcare providers and insured persons in the Wa Municipality of Ghana.

In Table 1, it is confirmed that Ghana's health insurance policy was efficient based on the efficacy levels assessed; i.e. the system (92%, Agreed), organizational (61%, Agreed), professional (69%, Agreed) and user (54%, Agreed) of mean-totals in percent, adjudged between the authority (Wa MHIA) and healthcare providers but to many insured persons, they were "uncertain" because they had little knowledge concerning how the policy supposed to operate.

## Determinants of Administrative Failure to Ensure Policy Efficiency for Health Insurance

Herein in Table 2, administrative failure of NHIS took it locus to ask whether the policy generally is efficient, made funds available to healthcare providers, practiced trustworthiness and loyalty towards other stakeholders. Table 2, has some statistics to that effect in the Wa Municipality of Ghana.

From Table 2, it was unanimously clear that; the NHIS is generally efficient but the controversies surrounding its efficiency is based on administrative failures to include; government delay to reimburse healthcare providers for their services, doubts of trustworthiness and loyalty among authorities, and insufficient space to review its drugs basket to enable providers provide quality of care to the insured. This, confirmed World Bank (1992) assertion of why health insurance policies are inefficient in the long-run and Ghana's case is no exception. Because, it was confirmed that; in the Upper West Region the government debt toll to healthcare providers as at the end of 2015 was **GHS19 million** (Bank of Ghana exchange rate as of March 22, 2017 was, 1 USD = GHS 4.48) of which the Regional hospital alone is owed **GHS4 million**. This explained why quality of service was poor and additional cost [on drugs] were shifted to the insured despite many were covered in the policy.

## Collaboration Between Authorities and Stakeholders to Ensure Efficiency of NHIS

From Fig. 1, it is essential that authorities and stakeholders work in consonance in policy deliberations and dialogue to ensure the efficacy of the NHIS. Table 3, presents data gathered from field:

Also, in Table 3, it was confirmed again that collaboration between the Wa MHIA and health providers did not fit well the insured. Despite collaboration being "good" between the Wa MHIA and healthcare providers, insured persons were not well engaged with appropriate measures as compared to other stakeholders. This affected deliberations and policy dialogue among stakeholders for efficiency of the policy.

Therefore, from the foregoing, it can be said that the inefficiencies in health insurance policies are based on administrative failures. Indicating that, if not taken into consideration, the long-run effect of health insurance policies will always become forfeited to the short-term gains due to high demand of healthcare from its populace outweighing what government can contain.

## Conclusion

In determining whether the NHIS is efficient or there were administrative failures making the policy inefficient, the chapter confirmed that the NHIS in a way is efficient but its administrative failures were what entangles controversies in the field of debate. This, the administrative failures were blamed on several factors to include; delays in reimbursing healthcare providers and therefore possibly raised issues of doubts of trustworthiness

levels. The burden of health care costs on the country as a whole will continue to grow unless and until policymakers alter the efficiency or efficacy of our health care systems. For these reasons and more, it is believed that it is essential that policymakers take action to restrain administrative failures when implementing policies.

## Administrative Ethics

Steven G. Koven
Department of Urban and Public Affairs, University of Louisville, Louisville, KY, USA

### Synonyms

Administrative ethos; Administrative integrity; Administrative morality; Codes of conduct

### Introduction

Texts that specifically address the question of ethics in the public sector identify a three-legged stool that focuses on the (1) consequences of action (utilitarianism), (2) inherent rightness or wrongness of actions (deontology), and (3) role of one's character (virtue) (Geuras and Garofalo 2005; Koven 2015; Svara 2015). These guides to behavior are discussed below as well as specific efforts to define ethics through formal codes.

### Utilitarianism

The philosophical theory of utilitarianism asserts that the worth of an action is determined solely by the consequences or end results of the action. Ethical behavior and proper action are linked to attain the greatest good for the greatest number.

Two of the pioneer figures of utilitarianism Jeremy Bentham (1748–1832) and John Stuart Mill (1806–1873) proposed that communities could be guided by the principle of maximizing pleasure and minimizing pain. By maximizing pleasure and minimizing pain, the greatest good for the majority would be realized. Under this perspective, if an action produced an excess of beneficial effects over harmful ones, it would be deemed ethical. Bentham formulated a specific methodology (hedonic calculus) for assessing pleasure and pain. He contended that the main sources of pain and pleasure were physical, political, moral, and religious. Pleasures and pain were evaluated according to measures such as intensity, duration, certainty, nearness, likelihood of leading to other pleasures, likelihood of not leading to pain, and scope.

John Stuart Mill further refined Bentham's ideas and cast them in a more humane light. Mill defended utilitarianism against attacks which proposed that the philosophy was nothing more than hedonism or pleasure seeking. Mill contended that utilitarianism would not lead people to forget or neglect their responsibilities. His worldview of utilitarianism was consistent with a belief that a moral community could be established by creating pleasure and happiness for individuals. Government would contribute to happiness by respecting individual liberty. Similar to the idea that an aggregation of individual wealth would define the wealth of nations (postulated by Adam Smith in his 1776 treatise *Wealth of Nations*), Mill viewed free people as the building blocks of a good state. He proclaimed that the worth of a state could be measured by the combined value of those who comprise it. Mill applied his philosophy of utilitarianism by serving in the British parliament and advancing social changes that he believed would lead to greater pleasure and less pain.

Critics of utilitarianism, however, questioned its practical application noting that the constructs of happiness, pleasure, and pain were difficult to operationalize. Committing morally reprehensible actions in the name of some ambiguous greater good was also difficult to justify. Ethicists question why the utility of the many should justify unconscionable harm to the few and whether some actions were intrinsically wrong. Furthermore, critics argued that one cannot definitely predict outcomes, and assessments of utility may be biased to benefit those in power to the disadvantage of the powerless (Svara 2015, p. 75).

## Deontological Ethics

Deontology focuses on the concepts of duty and principle. This philosophical perspective posits that acts are morally right or wrong in themselves regardless of consequences. It postulates the existence of moral absolutes that make an action moral regardless of circumstances. Under the precepts of deontology, people are autonomous; they act according to rules that they assign to themselves. It is believed that people act independently and may not choose to follow social convention even if they are pressured by others. Some deontologists believe in the "divine command theory" that insists moral obligations arise from God. German philosopher Immanuel Kant (1724–1804) further advanced the deontological view that ethical actions are voluntarily taken in obedience to a moral law. Obedience to such a moral law is guided by one's inner conscience. Moral laws are defined as those that can be universally applied; they are derived from practical reason.

John Rawls (1921–2002), a more contemporary political theorist associated with the philosophy of deontology, focused his scholarship on principles that could promote equality and justice. Rawls proposed that people cannot be totally objective because they occupy different positions in life. He believed that knowledge of factors such as one's status, income, age, health, ethnicity, religion, and political persuasion impaired one's rationality and weakened the possibility that one could act impartially. In order to resolve this dilemma, people should move behind a "veil of ignorance" or become ignorant of the position one occupied in society; one would then occupy an "original position." Rawls believed it was possible to formulate policies for the greater good for society if one operated from the original position (Rawls 1971).

Rawls proposed that two principles of justice should emerge if everyone were ignorant of their position in society. First, equal basic liberties for all citizens would be provided. These liberties include rights such as freedom of religion, freedom of speech, freedom of the press, right to assembly, equal protection of the law, guarantees of due process of law, guarantees of just compensation for taking of private property, and protection from cruel and unusual punishment. Second, social and economic inequities would be tolerated only if the inequities also advantaged the least well-off members of the society. Adherence to both of these principles would guide behavior, reinforce a sense of duty in people, and compel action.

Critics of deontology philosophy identify contradictions between principles and a lack of ordering between principles. They deride a lack of specificity in terms of how principles are to be applied in given situations (Svara 2015, p. 71).

## Virtue Ethics

Virtue ethics qualitatively differs from the other ethical frameworks in its focus on the role of one's character and the virtues that one's character embodies for determining ethical behavior. Virtue ethics or character ethics identifies with the nature of the person as a whole. Virtue theorists contend that developing morally desirable virtues for their own sake will aid in the decision to choose moral actions when such decisions are required. It is believed that virtuous individuals will choose noble behavior and shun ignoble behavior. Emphasis is placed on the value of good character in contrast to the value of obeying principles (deontology) or assessing the consequences of action (utilitarianism). The basic assumption of virtue ethics is that virtuous people will act ethically (Cooper 2004, p. 398).

Virtue ethics is by no means a new guide for behavior. It dates at least as far back as the time of the ancient Greek philosopher Aristotle (384 B.C–322 B.C). Aristotle and other Greeks had a profound influence on America's founders who highlighted virtue as a prerequisite for good government. For example, Madison noted that without virtue there was no theoretical check that could render citizens secure. Scholars speculate that America's founding fathers may even have been more comfortable with the virtue-centered ethics of character than the law-centered paradigm of duty (Hart 1984).

The study of virtue ethics faded in the West since the medieval period but enjoyed a revival of interest in the late twentieth century. The resurgence of interest is largely attributed to Alasdair MacIntyre who associated virtue with "internal goods" defined as all the good things that come from engaging in a practice (such as internal satisfaction, social bonding, advancement of what is considered excellent within the practice domain). In contrast, "external goods," such as money, power, and social status, are awarded by institutions. External goods are objects of competition, while internal goods are derived from cooperative practice (MacIntyre 1984, p. 190).

For MacIntyre, the modern focus on external goods does not encourage virtuous behavior. He contends that politics should concern itself with promoting internal goods. MacIntyre advanced the view that people should work together for a common good; they should work in cooperation to promote virtue and justice. This could occur within smaller communities where citizens have an ongoing role in setting laws and policy. These polities could enable citizens to judge political candidates on the basis of their actual character rather than through the distortions of advertising and the manipulation of propaganda. MacIntyre concludes that virtue is lacking in modern politics since people do not work together for a common good and do not work together to achieve justice.

Contemporary ethics scholars such as David Hart emphasized the need for moral trustworthiness of citizens. He contended that morality was a much stronger basis of governing than formal administrative structures. The virtuous citizen must critically examine assumptions, believe in the truth of American regime values, act as an independent agent in defense of regime values, and understand the nature and practice of civility (Hart 1984, pp. 114–116).

Other authors have also contributed to our contemporary understanding of virtue ethics.

Prominent among them is Michael Josephson, founder of a nonprofit organization that has trained government officials, corporate officers, Olympic athletes, and millions of schoolchildren in ethical decision making. Josephson denotes six pillars of character: (1) truthfulness (comprising honesty, integrity, reliability, and loyalty), (2) respect (comprising civility, dignity, and tolerance), (3) responsibility (comprising accountability, pursuit of excellence, and self-restraint), (4) fairness (including civility, dignity, and tolerance), (5) caring (consisting of benevolence), and (6) citizenship (duties that prescribe how one should behave as part of a community) (Josephson 2006).

Virtue ethics is not without its critics. Critics deride the possible use of virtuous qualities for dubious ends. For example, one may employ the character traits of industriousness in the pursuit of malevolence goals. One might believe in self-righteous fervor that one is virtuous while engaging in questionable conduct. History is plagued with cases of actors who believed they were ethical and virtuous while engaging in horrendous acts. The 9/11 attack on the World Trade Center is a recent example of actors who consider themselves to be highly ethical in their allegiance to religious dogma. In the name of virtue 9/11 attackers committed violence against innocents, striking out against those associated with a system they believed to be sinful.

Philosophy provides aids in defining right or wrong behavior. These aids, however, may not hold practical relevance for public sector workers who must make discretionary decisions every day in their jobs. In an effort to provide more practical guides for behavior, codes of ethics for public sector employees have been established.

## Codes of Ethics

Codes of ethics have been promulgated in an effort to establish greater ethical clarity. In 1924 the International City/County Management Association (ICMA) adopted a code that highlighted principles such as effectiveness, social responsibility, integrity, public interest, exclusion from political activities, competence in management techniques, courteous service, neutrality, fairness, diversity, and use of confidential information. More detailed guidelines accompanied principles. Guidelines address behavior such as accepting gifts, investments that conflict with official duties, private employment, and endorsing commercial products. Additionally, parameters for behavior were established with respect to conflicts of interest, running for office, self-assessment, and discrimination. The ICMA also promotes ethical conduct through its training programs, publications, technical assistance, and advice to members.

Following the lead of the ICMA, a Code of Ethics was adopted by The American Society for Public Administration (ASPA) in1984. ASPA's code was revised in 1994 and a new version was accepted in 2013. The 2013 code focused on eight core principles (Svara 2014, p. 564). Its core principles include: (1) advancing the public interest, (2) upholding the constitution and the law, (3) promoting democratic participation, (4) strengthening social equity, (5) fully informing and advising, (6) demonstrating personal integrity, (7) promoting ethical organizations, and (8) advancing professional excellence. The code affirmed ASPA's responsibility to develop the spirit of responsible professionalism within its membership and to increase commitment to ethical principles.

Codes of ethics are viewed as a useful step forward. Various scholars have praised codes of ethics for their ability to specify acceptable and unacceptable behavior in a profession, express expectations of behavior, and inform people outside the profession about what they can and should expect.

## Conclusions

The scholarly literature on administrative ethics is diffuse. Laundry lists of laudatory characteristics and prescriptions are often presented as heuristic models for proper behavior. Transcendent rights and wrongs are posited; consequences are assessed. These theoretical guides, however, may not be of great value for "street level"

bureaucrats who continuously face ethical questions at the margins. Theories only offer idealized visions of good behavior. They do not specifically answer the practical question of what to do when confronted with an array of ethical choices under stressful conditions.

Codes of ethics form a basic guide for behavior in organizations. These guides are enforced or not enforced within organizational contexts and standard operating procedures that have been adopted over time. Exhortations about the public good and public stewardship abound, yet consensus appears to be lacking on the precise parameters of acceptable behavior for public officials. To break away from the perception of administrative ethics as a utopian pursuit grounded in philosophy ethics research must provide greater clarity and practical value to public servants as well as to a disillusioned and cynical citizenry.

## Administrative Evil and the Holocaust

In *Unmasking Administrative Evil*, Adams and Balfour (1998, 2015) develop the concept of administrative evil in connection with the genocide perpetrated by Nazi Germany during World War II. While the evil – the pain, suffering, and death – that was inflicted on millions of Jews and others in the Holocaust was so horrific as to almost defy comprehension, it can be understood as facilitated by administrative evil. The administrative evil of the Holocaust is now unmasked (although much of it was masked at the time), and it can now be recognized as an instance of administrative evil because "the Nazis did it" and because it occurred well over 70 years ago. The Holocaust occurred in a modernized society and in a culture dominated by technical rationality and largely within and by organizational roles driven by legitimated public policy. While the Holocaust was horrific and arguably without precedent in human history, ordinary Germans fulfilling conventional administrative roles carried out extraordinary destruction in ways that had been successfully packaged as socially normal and appropriate.

While, understandably, history has focused on Hitler and his henchmen, the brutality of the

SS, the Gestapo, and infamous concentration camp doctors and guards, much less attention has focused on the thousands of public and business administrators such as those in the Finance Ministry who engaged in confiscations, the armament inspectors who organized forced labor, municipal authorities who helped create and maintain ghettos and death camps throughout Germany and Eastern Europe, corporations that profited from slave labor, and women who served in roles from secretaries to concentration camp staff members (Kaplan 1998; Allen 2002; Hayes 2004; Lower 2013). Genocide was often carried out in ways that were procedurally indistinguishable from any other modern organizational process. Great attention was given to precise definition, to detailed regulations, to legal compliance, and to record keeping, adhering to the modern, technical-rational approach to public service in every aspect. Many administrators directly responsible for the Holocaust were, from the technical-rational perspective, effective and responsible administrators who employed administrative discretion to both influence and carry out the directives of their superiors. Professionals and administrators such as Eichmann, Speer, and Arthur Rudolph diligently obeyed orders, followed proper procedures, and were even sometimes innovative and creative while carrying out their assigned tasks in an efficient and effective manner. Ironically, even the SS was very concerned about corruption in its ranks and with strict conformance to the professional norms of its order (Sofsky 1997).

Even within the morally inverted universe created by the Nazis, professionals and administrators performed their duties within a framework of ethics and responsibility that conformed to the norms of technical rationality. Hilberg (1989) pointed out that the professionals were "everywhere" in the Holocaust. Lawyers, physicians, engineers, planners, military professionals, and accountants applied their professional skills to the destruction of the Jews and other so-called undesirables. Scientific experiments were devised that dehumanized and murdered innocent human beings, showing the moral vacuity of the modern model of professionalism, while the vast majority of those who participated in the Holocaust were never punished, and many were placed in responsible positions in postwar West German government or industry as well as in NASA and other public and private organizations in the United States. The need for "good" and reliable managers to rebuild the German economy, and to develop key technologies such as in the American rocket program, outweighed any consideration of the reprehensible activities in which they were complicit.

Given what is now known about the Holocaust and how it was implemented, all professionals involved in public life should be vigilant towards the possibility of administrative evil. For example, the role of the professional civil service and public bureaucracy in the Holocaust should lead the field of public affairs to reconsider Woodrow Wilson's (1887: 220) classic formulation of the politics/administration dichotomy and his conclusion that, "By keeping this distinction in view, that is, by studying administration as a means of putting our own politics into convenient practice . . . we are on perfectly safe ground," which he wrote at the end of the nineteenth century before the horrors of the two world wars. Recognizing the role of administrative evil in the Holocaust makes it difficult to maintain that public servants, in whatever political or administrative context, can find a safe ground, because the public service, whether aware of it or not, facilitated genocide at every stage. As the "final solution" evolved, no part of modern professionalism – education, expertise, ethical standards, scientific methods, bureaucratic procedures, accountability to elected or appointed officials – could prevent or resist the genocide of the Jews. Public servants were both willing and helpless in the face of great evil. This remains true today, because administrative evil wears a mask. Thus all professionals in public life – scholars, students, and practitioners alike – need to reflect on the possibility that their technical-rational ethical standards and professional training may not adequately address the potential for administrative evil.

## Public Service Ethics and Administrative Evil

The concept of administrative evil relies on the premise that evil – when defined as behavior that inflicts pain, suffering, and even death on innocent victims – is an essential concept for understanding the human condition and specific ethical issues, including those in public affairs and administration. Administrative evil can be distinguished from other manifestations of evil and ethical failures because its appearance is *masked*, meaning that people can engage in acts of evil unaware that they are in fact doing anything at all wrong (Adams and Balfour 2015). Indeed, ordinary administrators may simply act appropriately in their organizational role, doing what those around them would agree they should be doing – and at the same time, participate in or contribute to what a critical and reasonable observer, usually after the fact, would identify as morally wrong and even evil. In the case of *moral inversion*, when something evil has been redefined convincingly as good, ordinary people can engage in acts of administrative evil while believing that what they are doing is not only procedurally correct, but in fact, good or ethical.

The mask of administrative evil results from four characteristics of modern society. One is the modern inclination to *unname*, or deny, the utility of the concept of evil, a premodern concept that does not resonate with the scientific-analytic mindset. The second is found in the structure of modern, bureaucratic organizations, which diffuses individual responsibility and requires the compartmentalized accomplishment of role expectations in order to perform duties on a daily basis. The third characteristic is found in how the modern culture of technical rationality – a way of thinking and living that elevates the scientific-analytical mindset and the belief in technological progress over all other forms of rationality – has analytically limited the framework for formulating and implementing public policy, so that moral inversions are now more likely. And the fourth is the ongoing production of "surplus populations," that is, large numbers of people who are denied the basic rights and protections of citizenship in a stable political entity.

During the twentieth century, the Holocaust and other eruptions of evil and administrative evil (such as the genocides in Bosnia and Kosovo) showed that the assumptions and standards for ethical behavior in modern, technical-rational systems often failed to prevent or mitigate evil in either its subtle or its more obvious forms. Conventional public service and business ethics – and professional ethics more generally – in the technical-rational tradition draw upon both teleological and deontological ethics and focus on the individual's decision-making process in the modern, bureaucratic organization and as a member of a profession. In the public sphere, deontological ethics serve to safeguard the integrity of the organization by helping individuals conform to professional norms, avoid mistakes and misdeeds that violate the public trust (corruption, nepotism, etc.), and assure the accountability of public officials in a constitutional republic. At the same time, public servants are encouraged to pursue the greater good by using discretion in the application of rules and regulations and creativity in the face of changing conditions (utilitarian ethics). The "good" public servant should avoid both the extremes of rule-bound behavior and the undermining of the rule of law with individual judgments and interests. Public servants operate within a partly tacit mix of different ethical orientations, with the mix often shifting from one situation to the next. Public (and private) organizations depend on at least this level of ethical judgment in order to function efficiently and effectively and to maintain public confidence in government (and business). At the same time, these ethical standards of an organization or profession are only safeguards, not fail-safes, against unethical behavior and administrative evil. Nor do they necessarily help individuals to resolve tough moral dilemmas that are often characterized by ambiguity and paradox in rapidly changing times.

The historical record suggests that the individual conscience is very weak relative to that of legitimated authority in modern organizations and social structures more generally, and that conventional ethical standards do too little to limit the potential for wrongdoing and even evil in modern organizations. And, despite the extensive

literature on public service ethics, there is little recognition of the most fundamental ethical challenge to the professional within a technical-rational culture: one can be a "good" or responsible administrator or professional and at the same time commit or contribute to acts of administrative evil. Administrative evil warns that individual administrators and professionals, far from resisting administrative evil, are most likely to be either helpless victims or willing accomplices. The ethical framework within a technical-rational system posits the primacy of an abstract, utility-maximizing individual while binding professionals to organizations in ways that make them reliable conduits for the dictates of legitimate authority (Vanderburg 2000), which is no less legitimate when it happens to be pursuing evil policies or practices. An ethical system that allows an individual to be seen as an effective or even good administrator or professional while committing acts or contributing to acts of evil is thus lacking in moral content, or even morally perverse. When administrative evil can be unmasked and understood, public servants should question the notion that ethical behavior always means following procedures and doing things the right or acceptable way. Norms of legality, efficiency, and effectiveness – however "professional" they may be – do not necessarily promote or protect the well-being of individuals, especially that of society's most vulnerable members. Further, new patterns of institutional and public corruption in the twenty-first century, from the prison of Abu Ghraib to institutions on Wall Street and global refugee crises, create conditions that seem likely to increase instances of administrative evil.

## Critical Perspectives on Administrative Evil

Not everyone agrees that administrative evil belongs in the lexicon of public affairs and administrative ethics. Dubnick (2000) offered a critique grounded in the positivist tradition of research that takes a dim view of nonscientific concepts such as evil and of research that does not conform to the standards of empiricism (in effect, a defense of the primacy of technical-rationality). Frederickson (2012) argued that a focus on administrative evil detracts from the good that is done by public servants and institutions and that a useful framework for public service ethics needs to be built upon what should be done rather than on what should not be done, and exceptional events like the Holocaust, so that public administration can fulfill its vital role in society: "A preoccupation with evil diverts public administration from these challenges and does little to elevate public service."

Moreno-Riano (2001) employs the theoretical perspective of Eric Voegelin to question whether technical rationality is the primary causal factor for administrative evil, arguing that both are the result of modern civilization's failure to take seriously metaphysical questions of existence, freedom, and human dignity as important dimensions of organizational reality. Likewise, the literature on organizational spirituality (Garcia-Zamor 2003) seeks to bring such considerations into the forefront in workplaces as an antidote to evil and the basis for more ethical and humane organizations. Other recent literature broadens the application of the concept of administrative evil to more specific settings, including organizational culture, power, and the professions (Jurkiewicz 2012).

## Conclusion

Perhaps the most important contribution of administrative evil to public affairs and administration can be found in expanding the boundaries of ethics with the realization that ethical failures sometimes consist of something other than failure to comply with the norms of technical-rational public policy and administrative practice, which are often simply assumed to be ethical. In this view, public administration certainly encompasses, but is not centered on, the use of sophisticated organizational and management techniques in the implementation of public policy and consists of more than how to progress as an "art, science, and profession." Practitioners and scholars of public affairs, and other related fields and professions, need to recognize that the

pathways to administrative evil, while sometimes built from the outside by seductive leaders, often emanate from within and can lead any professional down a surprisingly familiar route: from focusing on the job at hand, to a moral inversion, then to complicity in crimes against humanity. While the concept of administrative evil does not preclude the possibility of ethical organizations, it does suggest that public administrators must also, and primarily, cultivate a historical consciousness and awareness of surplus populations and the potential for evil on the part of the state and its agents: a societal role and identity infused not just with personal and professional ethics but also with a social and political conscious – a public ethics – that can see beyond the mask of administrative evil and refuse to act as its accomplice.

# Administrative Hearing

Gardenia Harris
Illinois State University, Normal, IL, USA

## Synonyms

Adjudications; Adjudicatory hearings; Adjudicatory proceedings; Evidentiary hearings; Formal adjudications; Trial-type hearings

## Definition

Administrative hearings are trial-like procedures federal and state administrative agencies use to adjudicate disputes between government agencies and the general public. The outcomes of administrative hearings, "administrative orders," resolve disputed facts, apply agency policies to individuals' and businesses' circumstances, determine policy in regard to a specific factual setting, and order compliance with laws and regulations (West's Encyclopedia of American Law 1998).

## Introduction

Administrative agencies conduct most of their work through informal procedures, such as handling applications for government benefits or processing tax returns. However, anyone who objects to an administrative agency's informal decision can request an administrative hearing. For example, people who feel agency standards are unclear or a decision violates their rights are entitled to have their objections heard before an administrative agency tribunal. Furthermore, if they are not satisfied with the outcome of the administrative hearing,

the decision can be appealed to the agency head, review board, or commission or challenged in court, a process known as "judicial review" (West's Encyclopedia of American Law 1998).

## The Administrative Procedure Act of 1946

The Administrative Procedure Act (APA) (5 U.S.C.A §§ 551–706) imposes uniform procedural requirements on most federal agencies and requires agencies to separate the judicial function from other administrative functions, including rulemaking. The APA provides the default procedures agencies must follow, including those for conducting administrative hearings – unless an agency's enabling statute requires other procedures (Cole and Shedd 2014). When the Congress stipulates in the enabling statute or elsewhere that an administrative adjudication must be formal, the agency must adhere to procedures outlined in the APA by holding trial-type hearings, known as "formal hearings." However, if the Congress has not specified that formal adjudications be used, agencies may hold "informal hearings." Informal hearings comprise a significant portion of administrative hearings (Mullins 2004). The APA does not prescribe specific procedures for informal hearings, but constitutional due process rights and the right of courts to overturn agency actions that abuse discretion, violate the law, or are arbitrary or capricious, establish minimum standards for such hearings (Gellhorn and Levin 2006; Goostree and Greenfield 2003).

Administrative hearings closely resemble court hearings. Like court hearings, administrative hearings are overseen by hearing officers who decide disputed issues with respect to specific parties, decide contested facts, apply the law to the facts, and conclude with an issuance of an order. However, administrative hearings differ from judicial hearings in several important ways. Administrative hearings often involve no adverse party; the applicant is the only party to the hearing with no one appearing on behalf of the agency to defend its denial of benefits or licensure. Also, unlike courtroom judges, the administrative hearing officer has a duty to assist the applicant in making his or her case (Funk and Seamon 2006). Civil and criminal courts embrace broader subject matter than administrative agency tribunals who concentrate on narrow activities such as benefits conferred by the government or a set of closely related economic activities. Finally, administrative courts mainly focus on assessing penalties for the violation of administrative or statutory regulations (Goostree and Greenfield 2003).

## Administrative Law Judges

Hearing officers who preside over formal hearings are called "administrative law judges" (ALJs), and hearing officers who preside over informal hearings are called "administrative judges" (AJs). Administrative law judges are appointed through a professional merit system based on their performance on a competitive examination and often their experience with a particular regulatory program (Gellhorn and Levin 2006). Although an employee of the agency, an administrative law judge is responsible for conducting formal proceedings, interpreting the law, applying agency regulations, and carrying out the policies of the agency in the course of administrative adjudications (Mullins 2004). Therefore, to ensure their ability to make fair and unbiased decisions, administrative law judges have statutory protections to ensure their independence. They are tenured employees who may not be assigned to perform duties inconsistent with their judicial functions (Gellhorn and Levin 2006). In addition, administrative law judges are not subject to most of the managerial controls which can be applied to other federal agency employees. For example, they are not subject to performance appraisals, and their compensation is determined by the recommendation of an independent agency, the Office of Personnel Management. Also, the agency can only take disciplinary action against an administrative law judge when good cause is established in proceedings before the Merit Systems Protection Board (Mullins 2004).

In instances where the APA does not apply or where statutes specify otherwise, informal

hearings are presided over by administrative judges who do not enjoy the same statutory protections as ALJs. However, agencies accord administrative judges a fair degree of independence and house them in independent organizations separate from the rest of the agency (Mullins 2004).

The powers of federal administrative law judges are defined in the APA, in the respective agency enabling acts, and in the procedural regulations promulgated by the agency. Thus, the specific duties of an ALJ vary widely among agencies (The Free Dictionary 2015). The APA authorizes administrative law judges to (a) administer oaths and affirmations, (b) issue subpoenas, (c) rule on offers of proof and receive relevant evidence, (d) take depositions or have depositions taken, (e) regulate the course of the hearing, (f) hold conferences for settlement or simplification of issues, (g) inform the parties about options for alternative dispute resolution and encourage its use, (h) require at least one representative for each party who has authority to negotiate resolutions of issues to attend any conference, (i) dispose of procedural requests or similar matters, (j) make or recommend decisions, and (k) take other actions authorized by agency rules consistent with the APA (Mullins 2004).

## Prehearing Procedures

Unlike most civil court cases, pretrial discovery, the opportunity for the respondents to discover the evidence against them, is not available for all administrative adjudications. Apart from the Freedom of Information Act, the APA contains no provisions relating to discovery against the agency, although it gives parities a limited right to obtain subpoenas against third parties. Likewise, many agencies enabling statutes fail to explicitly address discovery. Thus, some agency's procedures contain broad discovery provisions similar to those used in federal judicial courts, while others provide only limited opportunities for discovery. However, most formal administrative hearings are preceded by an investigation conducted by agency staff who are obligated to collect relevant information and evidence on behalf of all parties. If the investigation is thorough, it can serve as a proxy for discovery (Gellhorn and Levin 2006).

Administrative law judges prepare for prehearing conferences by reviewing the record to become familiar with the pleadings and the facts of the conference (Mullins 2004). During this phase, the hearing officer assesses the possibility of negotiating a settlement through alternative dispute resolution (ADR) techniques such as mediation or arbitration. In very simple cases, settlements can be negotiated during a conference call among all parties. More complex cases require an in-person prehearing conference during which the administrative law judges lay the groundwork for the hearing by identifying the issues and disputes to be resolved, arranging pretrial discovery (if it is available), establishing deadlines for the exchange of information and proposed evidence, and developing ground rules for the hearing. Regardless of the methods used, presiding officers prepare a transcript of the proceedings and a pretrial conference report with a list of parties who appeared, agreements reached, and rulings made. If pretrial discovery is available, in addition to requiring the parties to submit information, hearing officers may rely on subpoenas, dispositions, physical and mental examinations, etc., to obtain the information needed to decide the case (Mullins 2004).

The APA affords parties who appear for federal administrative hearings the right to notice of the hearing's date, time, and location, the statue involved, and the factual disputes to be decided (CQ Press 2012), the right to counsel, and the right to confront and cross-examine witnesses (The Free Dictionary 2015). The administrative law judge is responsible for providing timely notice to all parties with apparent interest in the case. Since administrative hearings may affect a broad spectrum of individuals and groups, in addition to contacting particular people, adequate notice may require the administrative law judge to contact industry representatives, professional associations, and other groups directly affected by the proceeding. Effective notice may require publication of notice in publicans that reach the

general public such as the *Federal Register*, trade journals, and media outlets (Mullins 2004).

## The Hearing

The procedures used to adjudicate claims or cases vary widely across agencies (West's Encyclopedia of American Law 1998), depending on whether the APA applies, the enabling statute, and agency procedures. Although many agency hearings follow an adversarial format, many administrative hearings, especially informal hearings, are not structured as adversary contests with presiding officers serve as referees. Hearings regarding welfare and benefit claims are often "inquisitorial" with the administrative judge questioning witnesses and eliciting relevant facts. In other situations, such as initial licensing cases, the administrative judge may simply certify a record that is then provided to agency heads and then issue a tentative decision subject to comment by the parties (Gellhorn and Levin 2006).

Formal administrative hearings resemble courtroom trials, are open to the public, and are conducted in an official manner (CQ Press 2012). Such hearings generally include the following elements:

(a) Convening the hearing – the administrative law judge convenes the hearing by announcing the title of the case and instructing the parties concerning the hearing format and procedures. Formal administrative hearings are recorded verbatim to ensure an accurate record (Mullins 2004).
(b) Opening statements – the complainant, often the agency, and respondent are represented by the counsel who establish the relief requested, provide an overview of the evidence and other relevant matters, and later introduce testimony and exhibits (Gellhorn and Levin 2006; Mullins 2004).
(c) Direct presentations – the parties present their cases in a predetermined order. Typically, the party with the burden of persuasion or proof makes the first presentation, followed by persons in support of his or her position. The opposing party and his or her supporters then present their case, followed by other interested parties (Gellhorn and Levin 2006).
(d) Cross-examination – the order of cross-examination is determined by the administrative law judge. Following the initial cross-examination by all adverse parties, redirect examination on matters brought out by the cross-examination occurs (Mullins 2004).
(e) Administrative law judge questioning – administrative law judges take a more active role in the hearings than courtroom judges because they are responsible for developing an accurate and complete record. To develop a complete record, the administrative law judge may actively question the parities and witnesses throughout the hearing. The administrative law judge identifies gaps in the record and insists they be filled. The administrative law judge also questions or cross-examines witnesses, calls additional witnesses when necessary, or raises important matters not covered adequately by the parties. Due to the administrative law judge's affirmative duty to try a case fairly, he or she may require the parties to provide additional oral or written information on germane issues or points or may even direct counsel to research a question of law and policy (Mullins 2004).
(f) Decision – the record is closed when the hearing ends. Each party then submits a memorandum to the administrative law judge and responds to the other side's presentations (CQ Press 2012). Unlike a trial, an administrative hearing has no jury; therefore, administrative law judges make both factual determinations and legal decisions based upon the evidence presented and the law governing the dispute (The Free Dictionary 2015).

Shortly following the hearing, the administrative law judge issues a decision, usually with written findings and a written opinion. This decision may be in the form of an administrative order that resolves a specific dispute

or violations of law (CQ Press 2012). An administrative law judge's decision may be either an initial or recommended decision. An initial decision becomes the final agency action, unless it is reviewed by an agency head or appeals board, while a recommended decision must be considered and acted upon by the agency leadership before it takes effect (Gellhorn and Levin 2006). Gellhorn and Levin (2006) note that if the proceedings involve routine application of settled principles to a particular fact situation, it is efficient to let administrative law judges' decisions become final without review by agency heads. However, when a proceeding is a "test case" to develop policy in an unsettled area, the use of a recommended decision assures that top administrators will review the decision and consider the policy implications of the case.

(g) Appeal – after the agency order has been served, the parities may appeal the decision to the agency review board or commission or the agency head. If the review uncovers omissions in the record, inappropriate procedures, insufficient evidence, or other inadequacies, frequently the case must be returned to the ALJ for correction or supplemental action (Mullins 2004).

After this review, the agency may adopt the administrative law judge's decision, reject it, or return it for further consideration. At this point, the agency's determination of the facts of the case is considered final (CQ Press 2012). However, the agency's decision is also subject to review by the courts. Courts can invalidate or return decisions that do not conform to agency procedures, rules for notice, evidence, or cross-examination or are based on insufficient evidence or other inadequacies (Funk and Seamon 2006; Mullins 2004).

## Conclusion

Annually, considerably more administrative hearings are held in the USA than courtroom trials. Administrative hearings are convened to adjudicate a wide swath of issues, ranging from individual claims for government benefits to disputes about what business mergers will violate antitrust rulings (The Free Dictionary 2015), giving them far-reaching influence over American life. Critics of the agency adjudication process, and administrative hearings in particular, argue that they violate core constitutional rights. Administrative hearings conducted by officers employed by the agency for which they adjudicate violate the constitutional principle of an independent judiciary. The current law allows agency heads and top administrators to rule on appeals for cases they initiated. Furthermore, critics challenge the notion that administrative law judges can be independent – even with the statutory protections Congress affords them. Furthermore, if people are not satisfied with the outcome of the administrative hearing, the decision can be appealed to the agency head, agency review board, or agency commission, or the decision can be challenged in court, a process known as "judicial review" (West's Encyclopedia of American Law 1998). The administrative judges who conduct informal hearings are often lower-level agency employees who lack the expertise and judicial experience needed to skillfully run hearings. Furthermore, administrative judges enjoy fewer protections than administrative law judges severely compromising their independence. Both types of judges are considered to operate under pressures that judges in the civil and criminal court systems would not tolerate. Suggested remedies for strengthening the administrative hearing process include shifting the administrative hearings back to the jurisdiction of Article III courts and adding additional procedures to the informal hearing process (Postell 2014).

# Administrative Intergovernmental Agreements, Russia

Ivan Leksin
School of Public Administration,
Lomonosov Moscow State University,
Moscow, Russia

## Synonyms

Administrative agreements between federal, regional, local governments; Intergovernmental agreements on public administration issues

## Definition

An administrative intergovernmental agreement is a negotiated arrangement between executive bodies and individual officials belonging to two or more governments within a country. Such a bilateral or multilateral document contains either legally binding or non-binding provisions devoted to public administration issues. Administrative nature of the discussed agreements manifests in three dimensions:

- Institutions and officials performing administrative functions act as the parties of the agreements.
- Execution of these functions is the primary matter of these agreements.
- The latter are usually subordinates to the legislative measures.

## Introduction

Russia belongs to a relatively small group of countries where administrative agreements have been being extensively used for shaping federal-regional, interregional, regional-municipal, and intermunicipal relations (see chapter ▶ "Multi-level Governance and Public Administration, Russia"). This can be explained by the fact that in Russia, executive bodies actually either dominate or have considerable political influence over legislative ones. However, unlike most countries noted for intensive usage of intergovernmental agreements, in Russia most of such agreements are considered to be legally binding. This feature makes intergovernmental agreement-making in the Russian Federation an attractive field for studies. It is also responsible for the fact that in Russia legal authors are most active in studying these agreements.

Scholars' activity in investigating the Russian practice of making administrative treaties and agreements peaked in the end of the twentieth century. That boost coincided with the intensive treaty-making aimed at the distribution of powers between federal and regional governments in

the 1990s. Hundreds of papers had been published at that time, including several monographs focused on the intergovernmental treaty-making (Demin 1998; Ivanov 1997; Leksin 1998).

In the beginning of this century, changes in the federal legislation regarding intergovernmental treaties and agreements gave an incentive to a new wave of publications on that issue. However, as the political significance of treaties in power-sharing has been fading away, the academic community started losing interest in studying this theme, although administrative agreement-making is still ongoing.

During the last decade, the scholars' interest in investigating this area has been coming down gradually. The recently published papers on the issues regarding intergovernmental treaties and agreements are mostly aimed at reviewing and recapitulating the prior publications (e.g., Bleshchik 2015; Chertkov and Kistrinova 2014; Krasnova and Pimenov 2011). Besides, a considerable number of published articles look like experts' reports rather than research papers (e.g., Cherepanov 2011; Zhdanov 2007). A gratifying exclusion is the sphere of local self-government that supplies researches with vast grounds for expatiations upon intermunicipal agreements (e.g., Shugrina 2008).

## Historical Background

In order to understand the present-day state of administrative agreement-making, as well as the scholars' estimations of this state, the past dynamics of such arrangements should be considered.

Up until the early 1990s, neither administrative agreements nor intergovernmental agreements on the whole had been provided for neither in Russian nor in the union legislation and occurred rarely. However, the end of the Soviet era was marked with unprecedented belief in the treaty-making as the perfect way to elaborate legal foundations for almost every issue. Decades of arbitrary and highly centralized decision-making undermined authority of the legislation. At the turn of the 1980s, large-scale reforms had been started that drastically enhanced democratic institutions at all levels of government. However, these changes had neither led to economic successes nor satisfied political ambitions of the newly ascendant regional elites. The said period had been marked with the rise of bilateral and multilateral relationships between constituent parts of the Russian Federation (see chapter ▶ "Multilevel Governance and Public Administration, Russia"). The highest form of such relationships was interregional association. The first association of that kind, "the Siberian agreement," was established in 1990. However, the right of the regional governments to conclude agreements was formally recognized in 1992 only, while legislative basis for association-making did not exist until 1999.

Interregional agreements were followed by the federal-regional ones. The beginning of the 1990s was the time of precipitous decentralization that actually bordered on feudalization. It led to the practical impossibility of using traditional legislative regulation of federal-regional relations and caused a burst of treaties and agreements.

The first document of this kind had been signed on January 22, 1992. This was a sectoral agreement on economic cooperation between the RF Government and the Tatarstan Republic Government. This document established a highly privileged status of the Republic in economic sphere. Inter alia, it granted Tatarstan full discretion in mining and disposal of natural resources, as well as in foreign economic activities.

Shortly thereafter three comprehensive intergovernmental treaties on delimitation of jurisdictions and powers had been signed. Together they were named the Federative Treaty of 1992 (see chapter ▶ "Constitutional Federalism and Public Administration, Russia"). They contained general provisions that had been subsequently incorporated into the then-current federal Constitution (Basic Law) and were rather political documents than administrative ones. However, they paved the way to the further extension of the intergovernmental arrangements.

The new federal Constitution of 1993 provided for the conclusion of intergovernmental treaties and agreements of various kinds:

- Treaties on the delimitation of jurisdictions and powers between federal and regional governments
- Agreements for delegation of powers between federal and regional executive bodies
- Treaties (with no subject specification) between regional governments
- Interregional agreements on the alteration of the interregional boundaries

Among these intergovernmental arrangements, the federal-regional treaties on the delimitation of jurisdictions and powers possessed the highest significance in the 1990s. During 1994–1998, 42 treaties of that kind were concluded with the 46 RF constituent entities. Similar to the Federative Treaty, these documents were rather political than administrative ones. Their primary objective was to lessen the tensions in the federal-regional relations by ceding further powers to the RF constituent entities. However, these treaties were congeneric with the administrative agreements in respect of their parties. The RF president and the regional leaders (see chapters ▶ "Head of the State and Public Administration, Russia" and ▶ "Regional Executives, Russia") were the officials that signed them, while the federal and regional parliaments neither participated in negotiating the terms of the treaties nor ratified them.

Despite the mentioned variety of the intergovernmental agreements provided by the RF Constitution, during the first years that followed its adoption in 1993, most numerous of the federal-regional agreements were the agreements on delimitation of powers in certain areas that developed the provisions of the treaties on the delimitation of jurisdictions and powers but had no constitutional basis. Such documents used to be signed by the chairman of the RF Government and by the premiers of the regional governments (see chapters ▶ "Federal Government, Russia" and ▶ "Regional Executives, Russia"). Besides, numerous agreements had been concluded in the 1990s:

- On cooperation, interaction, coordination, and relations in various spheres between the RF Government or the authorized federal ministry and respective regional bodies
- On transfer of funds and other money and credit issues between the RF Government, the RF Central Bank, and the respective regional bodies
- On the delimitation of public property between the RF Government or the authorized federal ministry and the respective regional bodies
- On the pension system issues between the RF pension fund and regional governments

In the early 2000s, both the mentioned treaties and the agreements on the delimitation of powers, as well as many of the agreements of the other types, were terminated or ceased to be applied (Leksin 2007). The last document on delimitation of powers had been signed in 2007 by the RF president and the president of the Tatarstan Republic. It did not have much political and administrative significance and expired in 2017. The government of the Tatarstan Republic had repeatedly offered to conclude a new treaty on delimitation of jurisdictions and powers. However, the federal government expressed no intention to prolong treaty-based relations.

## Contemporary Agreement-Making

Despite actual abandonment of concluding the treaties on delimitation of jurisdictions and powers between federal and regional governments, intergovernmental agreements are in great demand. This is true for almost all types of administrative agreements, including federal-regional ones. For instance, as of October 2018, hundreds of such agreements are in force, many of them having been concluded in recent years (Leksin 2007). These are the agreements:

- On the delegation of powers between the federal ministries and respective regional bodies, provided for by Art. 78, para. 2 and 3 of the RF Constitution, Federal Law

No. 184-FZ (as amended on July 4, 2003), RF Code on Administrative Violations (as amended in 2014–2015), decision of the RF Government No. 924 dd. December 8, 2008, on the procedures to conclude and to take effect of the agreements between federal and regional governments and on delegation of powers between them

- On cooperation, interaction, coordination, federal, and regional program implementation, on economic and social development between the RF Government or the federal ministries and respective regional bodies and between the territorial offices of federal ministries and respective regional ministries, provided for by federal bylaws (rules of the federal executive bodies), regional laws, and bylaws
- On the interbudgetary subsidies between the authorized federal ministries and regional governments and administrations, provided for by the decision of the RF Government No. 999 dd. September 30, 2014, "On Formation, Granting and Distribution of Subsidies from the Federal Budget to the Budgets of the Subjects of the Russian Federation"
- On subsidizing social security programs between the RF pension fund and regional governments and administrations, provided for by the decision of the RF Government No. 456 dd. June 10, 2011, on the financial support of social programs of the RF constituent units
- On the implementation of regional health protection programs, the Federal Ministry of Health, Federal Compulsory Medical Insurance Fund, and regional governments and administrations, provided for by the ministry's rules adopted by the decision of the RF Government No. 608 dd. June 19, 2012, ministerial order on the IGA-making No. 918n dd. December 10, 2013

Sometimes agreements with governments of the certain RF constituent entities turn out to be multilateral. This feature owes to the fact that dozens of federal executive bodies have regional and subregional divisions. Thus, dozens of federal supervision institutions can be found within the territory of a constituent entity and can participate in an agreement. Occasionally, multiple parties represent both the federation and the region. For instance, on September 18, 2009, agreement on cooperation had been signed by the officials of the procuracy of Astrakhanskaya oblast (all procuracies in Russia are part of centralized federal system of bodies responsible for general supervision over legality) and regional departments of the Federal Security Service, Federal Tax Service, Federal Service for Financial-Budgetary Supervision, and Federal Antimonopoly Service and by the officials of three executive bodies of Astrakhanskaya oblast (the Auditing Office, Agency for Press and Communications, Service for Security and Information Protection).

New administrative needs of parties have given birth to multilevel agreement-making. In the recent years, three-tier intergovernmental agreements have been being concluded. The Federal Law No. 473-FZ dd. December 29, 2014, "On Territories of Advancing Socio-economic Development in the Russian Federation" provided for the agreements on the delimitation of the territories intended for advancing socioeconomic development to be concluded by the authorized federal ministries, regional governments and administrations, and local administrations. Besides, a number of agreements on the application of the standard for economic competition development have been concluded in last 3 years by the territorial offices of the Federal Antimonopoly Service, regional governments and administrations, and local administrations (or region-wide associations of municipalities). However, the RF Government designed the agreements on these matters as regional-municipal only, providing no explicit grounds for participation of the federal officials in such intergovernmental arrangements in the Order No. 1738-r dd. September 5, 2015.

Besides, some nontypical federal-regional-municipal agreements can be found. For instance, on August 31, 2010, an agreement on cooperation was concluded between the RF Ministry of regional development, the Krasnoyarsk Krai Government, the Administration of Norilsk city, and the public corporation "mining and

metallurgical plant Norilsk Nickel" on the resettlement of residents of the cities of Norilsk and Dudinka to the regions with favorable natural and socioeconomic conditions.

Overall, federal-regional-municipal agreements have good chances to expand on various issues, as during the past decade, local governments, especially the governments of the upper-tier and single-tier municipal entities (municipal areas and city okrugs), have been required to fulfill the ever-growing amount of federal and regional mandates.

Surprisingly, direct federal-municipal agreements can also be found in the vast practice of intergovernmental relations. For example, in the late 1990s to early 2000s, local administrations concluded agreements with regional centers of the RF Sanitary and Epidemiological Service on delimitation of powers in the sphere of ensuring sanitary and epidemiological welfare of the population. Later federal-municipal agreements had been being concluded irregularly. For instance, on May 10, 2011, the procuracy of the Kabardino-Balkarian Republic concluded an agreement on the interaction and cooperation with the association of municipal entities of the named republic.

Interregional treaties and agreements are more common and much more diverse, of course. They include treaties and agreements on interregional economic associations; treaties on friendship and cooperation, interaction, and coordination; agreements on the alteration of the interregional boundaries; and agreements on the formation of new regions. Most numerous interregional agreements are the ones devoted to cooperation in various spheres (on trade and economic relations, policy in science and technology, cultural and social issues). Usually such agreements have served for political purposes and contain either no, or quite few, provisions that are legally binding (Kabyshev et al. 2009). To calculate total number of such agreements, even roughly, is quite a demanding job, as the information on making them is fragmented and scattered. Thousands of such agreements are currently in force. Some of these are the heritage of the 1990s, but new agreements are being signed quite often.

Regional-municipal agreements originated in the 1990s. These were primarily agreements on delimitation of powers styled after federal-regional treaties on delimitation of jurisdictions and powers. Such agreements had been being concluded in some RF constituent entities. Currently they are out of use. Contemporary regional-municipal agreements are devoted to the application of the standards for economic competition development, interaction and cooperation, social participation, interbudgetary subsidies, and formation of the territorial development zones. Among the listed types, only the last appeared to be nonviable. The Federal Law No. 392-FZ dd. December 3, 2011, "On the Zones of Territorial Development in the Russian Federation and on Amendments to Certain Legislative Acts of the Russian Federation" had never been applied. Currently there is no actual need for such zones and for the agreements on their formation consequently, as the Federal Law No. 473-FZ "On Territories of Advancing Socio-economic Development in the Russian Federation" dd. December 29, 2014, had provided for another type of intergovernmental agreements that were discussed above.

Intermunicipal agreements are the most numerous ones among administrative intergovernmental arrangements, as municipal entities (almost 22,000, as of January 1, 2018) naturally outnumber other public entities in Russia (see chapter ► "Institutional Foundations of Local Self-Government, Russia"). Among such agreements, both typical and specific types can be found. The typical ones are agreements on cooperation and similar issues that every government can participate in. The nontypical ones are agreements on jurisdictional issues that can be concluded between upper-tier (municipal districts) and lower-tier municipal entities (settlements). Until the distribution of powers between such municipal entities had been comprehensively specified in the Federal Law No. 131-FZ dd. October 6, 2003, "On the General Organizational Principles of Local Self-government in the Russian Federation," these agreements had rather political nature and were devoted to delimitation of powers. Subsequently, they were displaced by agreements on delegation of powers. These

latter became widespread, as the small settlements (especially rural ones) used to be dramatically underfinanced.

A few years ago, the list of issues within rural settlements' responsibility was curtailed radically according to the Federal Law No. 136-FZ dd. 27 May 2014, on amendments to the abovementioned federal laws No. 184-FZ dd. October 6, 1999, and No. 131-FZ dd. October 6, 2003. Consequently, spending obligations of these municipalities decreased significantly, and the demand for agreements with the municipal districts abated correspondingly.

## Conclusion

Through the decades that passed since the burst of intergovernmental agreement-making in the early 1990s, much had changed in Russia's legal and political layout. The system of intergovernmental agreements had undergone dramatic changes as well. First of all, a notable shift from political decision-making to public administration issues took place. Contemporary period is characterized by pragmatic and utilitarian attitude to all means of legal regulation, including intergovernmental agreements.

Abandonment of federal-regional treaty-making on delimitation of jurisdictions and powers has nothing to do with the decline of the intergovernmental agreement-making as a whole. In the 1990s such treaties became widespread because of the desperate position of the federal government, but not due to the advantageous features of the treaty as an instrument of decision-making. In fact, the federal government currently refuses just to revive intergovernmental treaties in inappropriately pompous form. It does not mean at all that the process of agreeing upon political interests has terminated, although this process had undergone inevitable changes following the dynamics in alignment of political forces.

As the political sphere of the intergovernmental agreement-making had been curtailed dramatically, the field of practical administrative use of intergovernmental agreements has increased due to the emergence of new areas of state activity. Besides, the federal legislator and federal executive had given birth to such new types of intergovernmental agreements, as the mentioned above federal-regional agreements on subsidizing social security programs and federal-regional-municipal agreements on parceling out of the territories of advancing socioeconomic development.

However, the actual scope of agreement-making is not clear, as the governments do not collect and provide the statistics regarding their agreement-making activities. Besides, the border between federal-regional or regional-municipal agreement-making and unilateral decision-making by the federal or regional government is relative. Quite often agreements are being concluded not for the reason that some matter needs to be negotiated upon but for the reason of being a legally prescribed stage of the decision-making procedure. Given that, there may be no actual difference often between entering into a formal bilateral or multilateral agreement and issuing a unilateral decision. In general, there is no solid reason to believe that conclusion of formal agreements in any sphere of governmental activity cannot be replaced with other regulatory tools.

Nevertheless, nothing indicates that administrative agreement-making shall be substituted with legislation and bylaw-making. The trend that can be observed is rather displacement of the obsolete types of agreements with the newly introduced ones. Hence, agreement-making is likely to remain an employed tool alongside with other instruments of public administration.

# Administrative Justice

Jack S. Monell
Department of History, Politics & Social Justice, Winston-Salem State University, Winston-Salem, NC, USA

## Synonyms

Crime control; Criminal justice; Due process; Restorative justice

## Definition

The activity and structure of the justice system encompass the courts, police, and correctional systems charged with ensuring punishment of criminals and safety for the community.

## Introduction: Early Historical Applications

In looking at the historical practices of the administration of justice, one would be remiss if they did not highlight how the criminal justice system has been disproportionally representative of African Americans and Latinos. Since the turn of the nineteenth century and the formation of the United States' criminal justice system, the concept of law and order was primarily predicated in ensuring that African slaves and subsequently freed slaves understood their place within the context of society. This ideology was extended to other ethnic groups primarily in urban areas throughout the United States. Justice administration defined, though varying in context and practice from state to state and country to country, is the activity and structure of the justice system encompassing the courts, police, and correctional systems (Aman and Mayton 2001). It further provides a legislative body authority over the practices used to ensure that justice is administered equitably.

As the United States is governed by the Constitution, much of what the layperson sees in relation to public policy and criminal justice is directly related to the rules of law and its applications. Prior to the implementation of the Constitution, the country was managed by the Articles of Confederation (Carp and Stidham 1990) which did not allow for a separation of executive and legislative powers. This proved to create issues in early attempts at administrative processes; hence, the early framers proceeded with the creation of the Constitution.

Though society has seen progression in the last 200 years, we continue to see areas of concern as it relates to not only the justice system but the judicial processes as well. As one of the five major

institutions of social control, the justice administration, or criminal justice component, was a societal attempt in ensuring public safety, protection, and accountability for those who violated not only societal norms but codified laws.

Where historically the debate has often reflected its application and whom was impacted more, we continue to see disproportionate arrests and convictions. Understanding that as an institution of social control the charge is to maintain law and order within a society, but to what extent? Justice administration in theory is the balance or fairness in the process of addressing societal ills without appearing impartial or biased. Robinson (2009) further discusses how assuring the scales of justice are not imbalanced and that all persons are treated fairly is critical.

Though distinctively defining justice or the administration of justice has baffled philosophers dating back to ancient Greece (Owen et al. 2012), throughout its evolution, many to date simply view it as being achieved through a set of policies and laws. How does justice impact not only me but my community, society, and the environment? It is solely not limited to crime and punishment but many of the systemic issues we see in education, healthcare, and employment and income inequality.

Justice administration or the commonly referenced application of it within the criminal justice system far extends that area, and we see it being referenced in procedural justice, social justice, and individualized justice. The administration of justice impacts all in any particular society.

## Views of Justice

Throughout the history of the American justice system, we have seen a continuous shift in how the concept of justice should be applied. In the same tone, Americans are quick to want individuals who commit crimes punished but then want to ensure that no bias has occurred. Some prefer harsher and swifter punishments as often discussed by nineteenth-century classical sociological theorists. For others, they prefer to address crime and punishment by guaranteeing that more therapeutic/vocational approaches are available to offenders working toward reintegrating back into society.

The main conflict is ensuring the efficacy of the process while maintaining the public's confidence in punishing those guilty of crimes. According to Harrigan (2000), "justice is served neither if a guilty person is let go nor if an innocent person is punished" (p. 35). Allowing officers to have wide policing discretion for the purposes of fighting crime may sound good to some, but then some of the liberties that many Americans enjoy may be impacted and sacrificed.

The continued work toward balancing the justice system is an evolving process. The justice network must strive to achieve balance between fighting crime, punishing the correct perpetrators, and safeguarding that we do justice for victims. Though the scales of justice do sway back and forth, particularly resulting from societal pressures, political agendas, and trends in crime patterns, rebalancing the "system" must occur periodically so that the community has faith in the process.

## Models of Justice

There has always been tension between those who subscribe to the crime control model versus the due process model. The crime control model is charged with protecting the community. This is achieved by lowering crime by any means within the confines of the law. Unfortunately, this at times means that innocent persons are convicted as well. The primary objective is safety first, with other elements of due process coming after.

Due process subscribes to the notion that all procedural components are in place and that all individual liberties have been adhered to with no violations. In this instance, sometimes the guilty may go free due to some constitutional violation that has taken place.

Despite the various differences in how each model is conceptualized and applied, both do view justice as an outcome. Looking at models politically, Democrats have historically viewed justice more liberally and subscribe to the due process model, whereas Republicans have been

more conservative in their approaches to justice and are more aligned with the crime control model.

Understanding that the practice of justice does stem from legislative powers and the laws produced, partisan-controlled houses could influence the direction of the administration of justice for a particular period. Partisan politics aside, when there appears to be an increase in crime, especially violent crimes, the public and its elected officials sway away from due process ideologies and push for more "get tough" approaches to fighting crime.

Presidential policies on crime and justice stems back to the 1960s when President Richard Nixon, a Republican, enacted the Omnibus Crime Control and Safe Street Act of 1968. Prior to the 1960s, crime or the administration of justice (minus Federal offenses) was more of a local matter and dealt with by municipalities as opposed to the broader sword of the Federal government. "Street crimes" during those periods were not a major concern for Federal politicians, let alone the Commander in Chief. Under Nixon's administration, the shift in the judiciary began as he moved toward appointing more conservative-minded judges that would be hard on crime (Mays and Ruddell 2008). Despite the intention to address criminality, this was also an attempt at the time to address the social unrest and nationwide activism protesting the Vietnam War and social injustices affecting many communities.

Thirty years late during the 1990s, under President William J. Clinton's administration, a Democrat, he dealt with one of the major crimes waves in US history. His approach was to be tough on crime more than any Democrat or Republican prior to him. This was directly resulting from the War on Drugs and the drug crime wave of the mid to late 1980s. Hence, the United States saw a rise in criminal convictions particularly for drug-related offenses. Under his administration, he made significant expansions of the war on crime, drugs, and terrorism (Robinson 2009). In 1994, President Clinton signed the Violent Crime Control and Law Enforcement Act and, in 1996, the Antiterrorism and Effective Death Penalty Act. These two examples of legislation pushed for harsher sentences with limited appeals, particularly for the death penalty cases on the Federal level (Maybrey 2005).

Twenty years later (2000s), we have now seen a shift in some of the drug-related convictions that were a direct result of mandatory minimum sentencing practices that convicted individuals (even first-time offenders) to long prison sentences. The unfortunate reality is that regardless to what model one sides with, some individuals will go free who possibly do not deserve to, where others are convicted just the same.

## Restorative Justice

A practice where the offender, victim, and community come together to restore some sense of normalcy and healing for the victim and accountability for the offender. Though communities are more inclined to view this approach as more conducive for juveniles and financial reparations, it also proves beneficial to assist in helping victims deal with being victimized.

Though not always appropriate for all circumstances, it has been used with some success in various types of offenses. In such cases, the victim and offender must have gone through a series of sessions to ensure both are prepared in meeting since their first encounter. Coming together to address the crime and for the offender conveying a sincere apology can go a long way in the healing process for a victim and possibly impacting legal actions. Haley (1986) states that for the apology, it can be powerful enough to render further legal action unnecessary.

## Ideological Justice

Looking at justice administration through the lens of one's ideological beliefs, also supported by government policy, is often the approach most Americans use in adopting their positions on how justice is managed throughout society. Granted, there are many ideologies that are represented in any given society, the objective or

goal is to find a common place where the diversity of society can be captured. Not an easy task, this becomes the continuous and daunting task as society's change, ideological beliefs shift, coupled with cultural views and norms.

## Justice Inequality

Understanding that there is no perfect society, albeit, within the United States or abroad, the administration of justice at best works in ensuring that equitable justice practices occur within the system to maintain that all of its citizens are being treated fairly, despite their actions or disagreements within a particularly society. Though historically, since the conception of this great land, we have seen bias, prejudice, and racism at its ugliest points in modern-day society.

Discrimination in justice administration is not just reflective of abusive policing practices but all aspects of the criminal justice system. From the initial arrest, through post convictions, to placements into prisons, we see systemic flaws at every phase that impacts individuals, families, and even the communities they represent.

Often debated is whether we need to address the continued discriminatory practices by some law enforcement officials, or should the legislation be revised, or should there be more training for our law enforcement officials? Is there a perception that people of color are more prone to criminality or violence, or is that a commonly themed media perpetuation? Russell (1998) argued this point in the 1990s where television images and programming heavily portrayed African Americans in a deviant manner. A constant barrage of negative images and character depictions gets imbedded in the minds and consciousness of those who view them, even for African American's themselves. Viewing certain negative characters in various media outlets, with no real interaction with described ethnic groups, one formulates their opinions and stereotypes based on those characterizations.

Some of the fear that we see directed toward African Americans or Latinos is heavily influenced by media outlets that have incredible reach or deeply rooted racially motivated beliefs stemming back from the slave codes and Jim Crow. Knowing that early in this country's history, the justice system did not view Africans, or their many descendants today, as a human; it is not inconceivable to see how certain segments in society view African Americans unfavorably, despite having the nation's first biracial (African American and Caucasian) president.

Despite some of the noted disproportionality in arrests and convictions historically, the justice system is an evolving process that strives toward an equitable system where the scales are actually balanced. As with most systems, changes and shifts take time, and the justice system is no different.

## Conclusion

In looking at justice administration from various perspectives and philosophical approaches, where faults are apparent, this system still works at ensuring that unbiased justice is practiced throughout the United States. As a model for even countries abroad, our system works hard in this regard. The complexity of the various components within the system is where it becomes unnerving as they operate independently but then rely on each other to keep the flow or process moving forward.

As previously discussed, though we have seen racial disparities and biases in the criminal justice system, those are not solely areas that are affected. We see how justice applies in all areas of our social institutions. As one of the major institutions of social control, it feeds into other areas as well which makes it incredibly impactful.

As the system continues to work toward addressing some of its systemic issues related to racism and discriminatory practices, especially toward marginalized groups and communities, it will improve. The justice system is an entity that is influenced by the legislators and the laws they pass. Depending on their ideological views of justice, it will ultimately determine how it is carried out in everyday life.

# Administrative Law and Government Employees

Nuri Heckler
School of Public Affairs, University of Colorado Denver, Denver, CO, USA

## Synonyms

Human relations law; Public employment law; Public management legal context

## Definition

Legal context of public personnel management.

## Introduction

US public administration is guided by a complex tapestry of laws concerning government workers. This legal framework developed over the course of US history, arguably starting with one of the foundational cases of US law. *Marbury v. Madison* (1803) is cited for the rule that the Supreme Court is the primary authority over constitutional law, but the Court also held that a justice of the peace appointed by a previous president could not be fired by the current president without sufficient justification until the completion of the 5-year term created by law. Since that time, laws covering the public workforce have expanded and spread in several directions.

## Four Goals of Law for Government Employees

Administrative laws governing public employees can be understood as serving four primary objectives. These objectives can reinforce each other, but they can also come into conflict with each other:

1. *To promote government efficiency* – laws that establish hiring and promotions based on merit rather than partisan allegiance and/or racial and gender stereotypes are often justified as creating a more effective and efficient government (Rosenbloom et al. 2010).
2. *To support equity in government* – often the same laws that promote efficiency have the effect of guaranteeing that employees will not face discrimination based on identities and affiliations that are not relevant to government work and by doing so help to prevent discrimination in government services (Naff et al. 2014).
3. *To strengthen democratic governance* – protecting public employees' freedom of speech is often justified by the claim that they are in a unique position to provide information to the public that is necessary for a democratic

government. Protecting government employees from discrimination is a way of improving the amount to which the bureaucracy itself is representative of the people. Other laws limit what workers can say in their capacities as public employees to make sure that the bureaucracy must abide by the wishes of the people (Rosenbloom et al. 2010).

4. *To protect government employees from abuse* – along with laws that protect public and private employees from unsafe working conditions, grievance procedures and whistle-blower protection laws give workers a voice in their working conditions (Rosenbloom et al. 2010).

This article provides an overview of laws that apply to public employees. It reviews important laws that guide and constrain working conditions in government, including requirements for hiring and promotions, hedges against discrimination, protections of constitutional rights, and health and safety considerations. This article is not a substitute for sound legal advice, and any real-world legal dilemmas should be resolved with the help of a licensed attorney. While the focus here is on the federal government, some mention will be made of laws governing state and municipal workers, especially in areas where the laws differ substantially.

## Hiring, Promotion, and Conditions of Employment

Legal requirements for hiring and promotion of government employees are as old as the nation, with protections for government employees embedded in the Constitution (Rosenbloom et al. 2010). These protections expanded dramatically after the assassination of President Garfield by a disgruntled job applicant in 1881. Responding to the practice of patronage for hiring in the executive branch, Congress passed the *Civil Service Act of 1883*, also known as the *Pendleton Act*, mandating competitive examinations for most jobs with the federal government (Rosenbloom et al. 2010).

The federal government and all 50 states require that merit be the determining factor in hiring and promotions of most public servants. Applicants to federal government competitive positions are often required to write knowledge, skills, and ability assessments because of language in the *Civil Service Reform Act* (CSRA 1978) requiring that hiring and promotion be made "solely on the basis of relative ability, knowledge, and skills,.."(§2301). All the states have similar legal requirements that hiring and promotion are based on merit rather than nepotism, patronage, or other prejudice. These requirements are thought to promote efficient government by identifying the most qualified applicants while simultaneously promoting equity and protection from discrimination. The agency tasked with creating the policies and regulations that ensure that hiring is based solely on merit in the federal government is the *Office of Public Management* (OPM 2018).

OPM must align "human capital strategies of agencies with the missions, goals, and organizational objectives of those agencies . . ." (CSRA 1978). If an agency violates the law and resorts to patronage or nepotism in hiring, OPM begins enforcement action. Other remedies for those who feel they are the victims of illegal hiring and promotions include reporting the violation to the organization's inspector general or filing a lawsuit (Naff et al. 2014).

While the law was originally reluctant to acknowledge that government employees had individual rights to their jobs, more recent case law and statutes have held that governments are constrained by the Constitution even in their role as employer. Once a person is hired to a federal job, and even before in some circumstances, that person has a property right to the job (Rosenbloom et al. 2010). The Fifth Amendment to the US Constitution (1789) protects persons, including government employees from being "deprived of life, liberty, or property without due process of law." The US Supreme Court (the Court) held that public employment is a property right and so cannot be terminated

without protections including fair notice and a minimal hearing. These requirements are referred to as "procedural due process" (Rosenbloom et al. 2010). For the procedural due process requirement to be met, the hearing must be "heard at a meaningful time and in a meaningful manner" (Mathews v. Eldridge 1976, 424:333) after balancing the interests of the employee, the interests of the government in efficient government, and the risk of mistakenly firing an employee. These constitutional requirements place a burden on government employers to strengthen democratic governance by demanding that employees not be terminated arbitrarily for political reasons or prejudice while at the same time protecting government employees from abuse.

The Contracts Clause also protects the public workforce and strengthens democratic governance; however, it only applies to state governments and requires only that states allow recovery of damages from a violation of a contract. The Contracts Clause of the Constitution mandates that "No State shall . . . . . pass any . . . . . Law impairing the Obligation of Contracts. . ." (Art. I, § 10, cl. 1). While the Supreme Court has not yet heard a case on the Contracts Clause for government employees, an appellate court held that a state law delaying payment for employees of Hawaii until the end of the month instead of the beginning was a violation because the law deprived employees of any means of recovering damages for the potential breach of contract (University of Hawai'i Professional Assembly v. Cayetano 1999). This is a high bar for state employees, who are unlikely to be able to appeal to the Contracts Clause for protection unless the legislature itself is breaching a contract without leaving any opportunity to recover money in damages.

Federal workers have no protections under the Contracts Clause, but they do have protections not afforded to other government employees under the *Federal Labor Relations Act* (FLRA). The FLRA was signed to law as part of the *Civil Service Reform Act* of 1978, described above. The FLRA protects employees' rights to engage in union activity, including attempting to start a union, or turning to a union for help with a working condition (FLRA 2018). The latter in FLRA parlance is called a grievance and is an important remedy that union employees can use to resolve problems with their employers, or with the union itself.

Unlike most employees of private companies, the FLRA forbids federal workers from striking. This restriction is placed on government workers' unions over concerns for public safety if police officers, air traffic controllers, or other safety workers should walk off the job. The FLRA also gives employees the ability to collectively bargain for working conditions that are not related to wage, hours, or other terms of employment while requiring that the government bargains with the union before certain enumerated working conditions and any working conditions for which the union has previously bargained.

Unions in state and municipal governments have a tapestry of protections created by the states. Despite lacking a federal law that protects union members in state and municipal governments, state and municipal employees are more likely to be union members than federal workers and more than four times more likely than private sector employees who are protected by a different federal law. While federal unions are not permitted to strike, at least 12 states have granted public employees limited rights to strike (Naff et al. 2014). These facts have led some scholars to argue that local and state unions are better off without a federal law (Walker 2014).

All workers, regardless of sector, have employment rights that are mostly focused on protecting employees against abuses. The *Fair Labor Standards Act* (FLSA 1938, commonly pronounced "*flissuh*") empowers the Department of Labor (DOL) to enforce the minimum wage, overtime pay for hourly employees, and child labor laws and requires employers to record and report certain data pertaining to employees (DOL 2016). Government employers are not exempt from FLSA protections.

Employees of the 25% of companies who contract with the federal government often have additional rights and protections. Laws and executive orders specify that contractors with the federal government must pay their employees the

regional prevailing wage (DOL 2016). Additionally, many contractors are required to provide paid sick leave and must also make contributions to their employee's health insurance.

Regulations, statutes, and the Constitution constrain government employers in ways that they do not in the private sector, and some of these protections extend to private contractors working with the government (Rosenbloom et al. 2010). Hiring government employees must be based on merit alone, not family relationships or political beliefs. The labor rights to unionize federal government offices are protected by the FLRA, but that might be part of the reason that state and municipal workers who are protected by various state laws are more likely to have joined unions. One place where human relations law remains the same across sectors is in administering basic wage and hour laws under FLSA. The next section discusses how the law guarantees that government does not discriminate against public employees.

## Discrimination

While courts have established legal principles concerning discrimination in government employment, the law is contested and continues to evolve. The 14th Amendment of the Constitution includes the "Equal Protection" clause. Law coming out of this clause is commonly referred to as Equal Protection or EP. This clause reads "No State shall . . . . . deny to any person within its jurisdiction the equal protection of the laws." In this literal reading, Equal Protection applies only to the states, and the Supreme Court has held that this clause also applies to local governments. It was this clause that the court cited in the famous *Brown v. Board of Education of Topeka* (U.S. 1954) to outlaw segregation in local government-run school districts.

On the same day that the court released the holding in *Brown v. Board*, it also released *Bolling v. Sharpe* (*U.S.* 1954) holding that the federal government was also bound by the Equal Protection clause, not because it was a state but because it was impossible for people to have *due process* under the Fifth Amendment without getting equal protection under the law. For this reason, equal protection law that is applied to the federal government is often referred to as "substantive due process," and this phrase is sometimes used to refer to Equal Protection law applied to state and local governments as well.

Under the equal protection clause, government employee identities receive different types of protection. Given the history of racism in America, the Court was justifiably protective of government action that discriminated between races and so established a very high bar for government actions that even consider race in decision-making. The test for government decision-making that distinguishes between races requires that the government action must be the least restrictive means for achieving a compelling state interest (see Table 1) (Epstein and Walker 2007). This level of scrutiny is referred to as strict scrutiny and is applied to race, national origin, alienage (the state of not being a US citizen), and religion. In practice, this standard means that the government can almost never consider these factors when making decisions.

**Administrative Law and Government Employees, Table 1** Substantive Due Process Tests by Identity

| Test | Identity | Standard |
|---|---|---|
| Rational basis | Age, disability, anything not listed | Law must be *rationally related* to achieve a *legitimate government purpose* |
| Rational basis with bite | Sexual orientation, children of undocumented immigrants | Law must be *rationally related* to achieve a *legitimate government purpose*, and *not single out a group for discrimination* |
| Intermediate scrutiny | Sex, birth legitimacy | Law must be *substantially related* to achieving an *important governmental objective* |
| Strict scrutiny | Race, alienage, religion, national origin (also fundamental rights) | Law must be the *least restrictive alternative* for achieving a *compelling state interest* |

Adapted from Epstein and Walker (2007, p. 621)

When considering a person's sex, the Supreme Court determined that women were inherently different in some ways, like the fact that they bear children, and decided that government should be able to consider sex differences when they are substantially related to an important government objective (Epstein and Walker 2007). This level of scrutiny is referred to as heightened scrutiny, or intermediate scrutiny, and applies to government actions made based on sex or the legitimacy of one's birth (i.e., bastardy). This lower bar is not always detrimental to gender equality advocates. Because this bar is not nearly as high as the bar for considering racial differences, some programs that are designed to create equality, such as affirmative action programs, can be easier to implement on behalf of women than on behalf of people of color (Epstein and Walker 2007).

There are several instances when the government needs to be able to readily discriminate between people. For example, when hiring a lawyer, the government needs to be able to discriminate between people with and without a law degree. For most categories of identity, including age and disability, the standard the government must meet when making a decision is that the discrimination based on identity be rationally related to a legitimate government purpose (Epstein and Walker 2007). This level of scrutiny is referred to as rational basis, and when the court reviews decisions under this standard, the government is almost always permitted to discriminate (Holoszyc-Pimentel 2015).

The one notable exception to the low bar for rational basis scrutiny involves discrimination against gays and lesbians. In the case, *Romer v. Evans* (1996), the court held that the state electorate could not pass a law that forbade municipalities from giving protections for sexual orientation using rational basis scrutiny, arguing that no legitimate government purpose could be met by singling out a group of people for discrimination. This case has led some to argue that sexual orientation, or at least gay and lesbian identities, receives a little bit more than rational basis, or "rational basis with bite" (Holoszyc-Pimentel 2015), but not quite intermediate scrutiny (see Table 1). Other cases have applied a similar rational basis with bite standard to the children of undocumented immigrants and to people harmed by laws of a nearby state where they are not allowed to vote (Holoszyc-Pimentel 2015).

While these constitutional provisions only apply to government decisions, several other laws apply to most employees and deal with discriminatory effects as well as the motivations behind decisions. The Equal Employment Opportunities Act (EEOA 1974) makes it unlawful for most employers, including governments, to use race, color, religion, sex, or national origin as "a motivating factor" in making a decision about employees, even if other factors were also motivating the decision. The EEOA has created a statutory and regulatory scheme for bringing discrimination lawsuits against employers. The EEOA forbids creating discriminatory outcomes, even when the actions themselves are not intended to discriminate. These discriminatory outcomes are called "disparate impacts." Once discrimination or disparate impact is proved, the employer can defeat a lawsuit by showing that the discriminatory practice is a "business necessity" (EEOA 1974).

Discrimination based on disability is scrutinized using the rational relationship standard under constitutional equal protection, but the *Americans with Disabilities Act* (ADA 1990) gives extra protection to employees who have physical or mental impairment in the public or private sector. The ADA mandates that employers make "reasonable accommodation" for people with any kind of disability. Reasonable accommodation includes modifications to the work setting that enable people with disabilities the same employment opportunities as others. Accommodations are reasonable so long as they do not impose an "undue hardship" on the employer and can include hiring an interpreter for a job applicant who is deaf or adding a universal access restroom. Another identity that is protected by statute but not the Constitution is age. The *American Discrimination in Employment Act* (ADEA 1967) prohibits public and private sector employers from discriminating against employees who are over 40 based on their age.

There are some groups for whom the federal government is instructed to discriminate. In *Morton v. Mancari* (1974), the Supreme Court held that a preference for hiring American Indian tribal members for the Bureau of Indian Affairs was neither unconstitutional nor prohibited by the EEOA because the discrimination was based on tribal affiliation, not race, and because tribal affiliation is rationally related to furthering the self-sufficiency of Indian nations. Similarly, Veterans of wars, the Iraq campaign, and the Afghan campaign receive a hiring preference in the federal government, and preference is also applied to certain family members of a veteran killed or permanently disabled in honorable service (OPM 2018). Additionally, active duty personnel on national reserve have a right to reclaim their job after they are deployed for up to 5 years, and employers are prohibited from discriminating against them based on the possibility of deployment (OPM 2018).

These discrimination laws promote equity, protect employees from abuse, and promote democracy and efficiency. Laws promoting veterans are concerned that veterans are mistreated and are determined to recruit better candidates for the military by promising them work benefits after their tours are over. Similarly, preferences for American Indians to administer programs serving Tribal Nations are designed to promote democracy and create equity for all tribal members. The EEOA, ADA, and ADEA protect employees from abuse based on some characteristics, but they also create a hedge against discrimination by government against people who share the characteristics generally protected by the laws. This supports democracy as well by creating governments that include more of the voices they serve and represent, especially when you grant these same employees protections for their speech.

## Speech and Ethics

Government employees have the rights that other citizens enjoy, but those rights sometimes conflict with their job requirements. The freedom of speech, the right to privacy, the right to marriage, and the right to be free from unlawful search and seizure are all referred to as "fundamental rights" by the Supreme Court. The same strict scrutiny test used for equal protection claims applies to government actions that infringe on these fundamental rights (Epstein and Walker 2007). Therefore, for the government to infringe on the freedom of speech, the government must show it did so for a compelling state interest and that there was alternative means of achieving that state interest that minimized infringement on the fundamental right (Heffernan v. City of Paterson, NJ 2016). For public employees, the government interest in running the government efficiently can constitute a compelling state interest (Heffernan v. City of Paterson, NJ 2016).

Government employees' fundamental rights are protected, but they are balanced against the need to run an efficient and effective government. This balance is called the Pickering Test because it was introduced by the Supreme Court in the case, *Pickering v. the Board of Education* (1968). The Supreme Court recently affirmed the Pickering Test in a case of a police officer who agreed to pick up a campaign sign for his ill mother, and drove to the campaign headquarters of a man running for mayor against the incumbent (Heffernan v. City of Paterson, NJ 2016). Other police officers witnessed him picking up the sign, and the next day he was demoted for supporting the wrong candidate in the election. The Supreme Court held that he could not be demoted for opposing the incumbent mayor, but stated that the officer could have been demoted for partaking in political speech if it was necessary to promote "practical realities, such as the need for efficiency and effectiveness in government service" (Heffernan v. City of Paterson, NJ 2016, 136:1417).

In theory, the Pickering Test implies that fundamental rights could legally be infringed by the government employer when efficiency and effectiveness dictate, but in case law employees are almost always protected when their fundamental rights are abridged. To find for the government, the Court generally avoids finding an infringement of a fundamental right in the first place. For example, the court in *Connick v. Meyers*

(1983) held that a district attorney could be fired for her speech about her job conditions because she was not speaking about a matter of public concern and therefore was not speaking in the way that is protected by the Constitution. In this case, no Pickering Test was applied because no fundamental right was infringed.

Usually, once a government employer has been found to violate a fundamental right of an employee, the Pickering Test has been used to find for employees' rights. One appellate jurisdiction has adopted a line of cases that is the exception that proves the rule, finding that police as paramilitary agencies require higher levels of discipline and so "are entitled to impose more restrictions on speech than other public employers" (Brickey v. Hall 2016, 828:304). So far, most other jurisdictions have declined to adopt this reasoning, and the Supreme Court has not yet considered such a case. In general, courts find that public employees have expansive speech rights because they are in a position to inform voters about "matters of public concern" (Heffernan v. City of Paterson, NJ 2016; Pickering v. Board of Ed. of Township High School Dist. 1968).

The ability of public employees to shed light on matters of public concern is also the reason behind many whistle-blower laws. Whistle-blower laws usually protect public employees from being fired or experiencing other forms of retaliation, but they can also reward public employees who save the government money with a portion of the money saved (Kohn 2011). Whistle-blowers risk being fired or otherwise aggressed when they point out fraud and other malfeasance in the government, and Congress has determined several times that they should be rewarded for taking such a risk. The *False Claims Act of 1863* was signed by Abraham Lincoln in reaction to scams implemented by civil war profiteers and updated in 1986 in response to the treatment of whistle-blowers who sounded alarms before the Space Shuttle Challenger disaster.

The law includes provisions for rewarding whistle-blowers that save the government money, called qui tam provisions. Similarly, the tax code, the Securities Exchange Act, the Commodity Exchange Act, the Dodd-Frank Consumer Protection Act, several environmental protection laws like the Clean Water Act and the Superfund Act, the Occupational Safety and Health Act, transportation laws, and the 2009 stimulus signed by President Obama all include protections for whistle-blowers in the interest of government efficiency. The Civil Service Reform Act (1978) includes protections for federal workers who blow the whistle on illegal human relations practices. Similarly, both FLSA and the FLRA provide protections for employees who blow the whistle on employers who mistreat their employees. Whistle-blower protections are limited for national security employees due to the need to keep national secrets, and specific laws limit the speech rights of the Department of Defense, Federal Bureau of Investigations, and other homeland security and paramilitary employees (Kohn 2011). What is almost never limited is the right of public employees to speak to elected officials, and the Federal Labor Relations Act (1978 § 7102) specifically protects this right.

Ethics laws do not protect government employees who speak out but rather dictate when and how they are permitted to exercise their freedom of speech. Although it is not often described, thus, laws and regulations enforced by the Office of Government Ethics are often encroachments on government employees' fundamental rights that pass the Pickering Test. The primary statute dictating ethics requirements is known as the *Hatch Act* (1939). Generally, the government may not restrict citizens' affiliation with political parties, but ethics laws ban federal employees, including most military personnel, from several types of association with political parties, including soliciting political contributions for political candidates except under specific circumstances (*Hatch Act* 1939; *Political Activities by Members of the Armed Forces* 2008). Similar state-level laws restrict political activities in most state and local governments, and those that receive government funds must

also abide by the federal *Hatch Act* (Bowman and West 2009).

Ethics laws also constrain public employees from having financial interests that conflict with the public interest. In an effort to guard against bribes, government employees may not accept gifts from anyone who has business before the agency (OGE 2017). Similarly, government employees may not hold a financial stake in any organization they oversee, nor may they investigate any business with which they are pursuing employment (OGE 2017). The general purpose of ethics laws is to promote efficiency and strengthen democratic governance that is undermined by government employees who attempt to serve more than one master.

While at first glance, it may seem that the purpose of Constitutional law concerning government employees' fundamental rights is primarily focused on protecting employees from abuse, the Supreme Court and subsequent laws on speech and ethics make it clear that the primary objective of these laws is often to strengthen democratic governance. The Supreme Court repeatedly justifies protections of free speech rights based, not on the inalienable rights of public officials, but on the need for the public to know about the internal workings of government, and the number of whistle-blower protections backs up this reasoning. The ease with which ethics regulations limit the fundamental rights of government workers to associate with political parties and search for work also backs up the idea that free speech for public employees is first and foremost about strengthening democratic governance and only secondarily about protecting workers from abuse.

## Health and Safety

Two laws are dedicated to protecting both public and private sector employees from abuse – the Occupational Safety and Health Act (OSHA 1970, pronounced "*oh-shuh*") and the Family and Medical Leave Act (1993). These laws guarantee minimum safety and health standards and promote equity by helping women, who bear an outsized burden of caring for the health and wellness of their families and constitute a majority of the federal workforce (OPM 2018). While workers' health is important in itself, a healthy workforce is also better for efficiency. Both OSHA and FMLA serve all of these goals.

OSHA (1970) protects from hazards that might kill or seriously injure employees. The law applies to all government contractors working in construction or other fields where serious injury is likely. Similarly, OSHA (1970) regulations mandate safety in office spaces including fire protections, access to clean water and toilets, access to medical and first aid, and numerous other potential hazards. As noted above, OSHA (1970) includes whistle-blower protections, and without whistle-blowers, the underfunded Occupational Safety and Health Agency would be unable to protect many workers (Kohn 2011). Some municipal and state governments have specific OSHA implementation agreements that create heightened standards, but the law and its whistle-blower protections are applicable to almost all employers, including nonprofit and for-profit companies.

The FMLA (1993) is similarly applicable to almost all governments and contractors. The FMLA protects employees who take up to 12 weeks off because they are ill or their close family members are ill. Employees are not guaranteed pay during their leave, but they are guaranteed a job when they return. Valid reasons for leave include an employee's own illness, maternity and paternity, adopting a child, and caring for a seriously ill parent, spouse, or child. Relatedly, President Obama's health-care law included a section mandating reasonable accommodations for breaks and private space for nursing mothers to express breast milk while at work (DOL 2016). It is notable that the laws primarily focused on protecting workers apply similarly to both public- and private sector employees, while laws that are only applicable to public employees are more often aimed at promoting efficiency, democracy, and equity. This indicates that public

employee protections may be more often justified as protections of the nation and the people rather than the employees.

## Conclusion

The laws described here do not constitute all the legal and regulative constraints on the public workforce. Multiple volumes have been written on each of these laws. This article is intended as a starting point for researchers and practitioners by clarifying the legal context of government employment, including the constraints placed on public managers, the rights and protections for government employees, and the multiple aims of this multifaceted legal framework.

# Administrative Law and Public Administration, Russia

Ivan Leksin
School of Public Administration, Lomonosov Moscow State University, Moscow, Russian Federation

## Synonyms

Administrative legislation; Legal provisions regarding public administration matters

## Definition

In Russian, two separate notions correspond to the English collocation "administrative law." The first one is closer to legal practice than to the legal theory and can be rather defined as administrative legislation comprising of statutes, bylaws, and other formal documents that affect federal and regional administration. According to the Russian legal doctrine, this body of legal sources should be distinguished from the administrative law in the theoretical sense. The latter refers to the content of the administrative legislation, but not to the legal documents themselves.

The academics see every branch of law as a system of legal provisions that are connected through the congeniality of the affected matters and the uniformity of the regulation techniques (Agapov 2019; Alekhin and Karmolitskiy 2018). Thus, administrative law constitutes a system of mostly prescriptive (imperative) provisions that affect a wide variety of public administration issues:

- Formation, composition, and functions of the executive governmental institutions and their performance and relationships (see chapters ▶ "Federal Government, Russia," ▶ "Multi-level Governance and Public Administration, Russia," and ▶ "Regional Executives, Russia")
- Public service, including civil service, military service, and service in the law-enforcement agencies, institutional system and procedures for the recruitment and dismissal of public servants, social security for the acting and retired public servants, etc.
- Administrative offenses and administrative discipline
- Administrative decision-making, including governmental and ministerial procedures, making executive bylaws, administrative agreement-making (see chapter ▶ "Administrative Intergovernmental Agreements, Russia"), and licensing, certification, and execution of supervisory powers and administrative and disciplinary proceedings

The Russian scholars had been long used to extend administrative law to include court procedures regarding administrative offenses and administrative disputes. However, the recent decades show a persistent trend to conceptualizing the law of administrative procedures as a separate branch of Russian law (Zelentsov et al. 2020).

## Introduction

Administrative law is commonly considered to be the branch of law that bears the larger portion of responsibility for the public administration practices. As far as the listed matters cover the great part of the governmental activities, administrative law appears to be an outstandingly massive branch of the Russian law. It encompasses numerous sources created at both federal and regional orders of government. Administrative law also belongs to the most complex branches of law. It contains a number of sub-branches, referring to public service, administrative procedures, police activities, and public administration in particular sectors (domestic affairs, foreign affairs, economic development, science and education, industries, agriculture, transportation, communications, emergency management, etc.). Consequently, by the quantity of legal provisions and of the legal sources, administrative law excels every other branch of the Russian law.

## Administrative Law and Adjacent Branches of Law

Since the unanimity of the Soviet legal doctrine had vanished, numerous views on the systematics of legal provisions regarding public administration can be found. As mentioned above, some scholars stand up for independence of the administrative procedures law; others conceive it as a part of administrative law. Autonomy of subject-based groups of legal provisions related to public administration is also a matter of disputes. The narrow specialists argue in favor of treating such spheres as housing, transportation, forestry, power

engineering, and mineral industry like separate branches of law, while most academics adhere to understanding administrative law as a single branch encompassing the named spheres. Yet the scholars tend to recognize some other administrative-based divisions of law as independent branches. These are, particularly, the information law (that contains provisions governing data management), environmental law, and social maintenance law.

However, within the body of provisions governing public administration issues, the scholars generally acknowledge a number of branches of law separate from administrative law. These are primarily constitutional law (see chapter ▶ "Constitutional Law and Public Administration, Russia"), municipal law (see chapter ▶ "Institutional Foundations of Local Self-Government, Russia"), and financial law.

## Sources of the Russian Administrative Law

Administrative provisions can be found in multifarious sources: in the Constitution of the Russian Federation; in the federal constitutional laws and ordinary federal laws; in the presidential decrees; in the decisions of the RF Government; in the orders being issued by the federal ministries and other executive bodies subordinate to the RF President and to the RF Government; in the constitutions, statutes, laws, and bylaws of the RF constituent entities; in the rulings of the Constitutional Court and of the Supreme Court of the Russian Federation; and in the administrative intergovernmental agreements (Leksin 2018).

In fact, most of these sources are multibranch in their nature, as far as ascribing provisions to different branches of law does not make a strong practical ground for distributing these provisions between different sources in case these provisions are devoted to a single matter. Thus, most sources of administrative law are at the same time the sources of constitutional, municipal, financial law, etc.

The supreme of these sources is indisputably the RF Constitution of 1993. It contains dozens of provisions that set the guidelines for the institutional basis of public administration, define the functions of the RF Government, and outline the mechanisms meant for constraining officials from arbitrariness (see chapter ▶ "Constitutional Law and Public Administration, Russia"). Recently the RF Constitution has undergone extensive changes through the Amending Law No. 1-FKZ dd. 14 March 2020, "On Developing Regulation on the Matters of the Public Authority Organization and Functioning." A larger portion of the alterations focused on the RF President and on the RF Government. In particular, the latter is henceforth officially considered to operate under President's general direction (see chapter ▶ "Head of the State and Public Administration, Russia"), the formation of the federal Government now depends on both chambers of the federal parliament, and the list of the governmental powers becomes more specified and relevant. Besides, the mentioned law provides for more close interaction of the local governments (see chapter ▶ "Institutional Foundations of Local Self-Government, Russia") with the upper ones and incorporates basic requirements for entering upon key public administration offices into the RF Constitution. These offices include members of the RF Government, other heads of federal executive bodies, and regional chief executives (see chapter ▶ "Regional Executives, Russia").

A federal constitutional law is a designation for a statute that does not amend the federal Constitution but elaborates upon a subject specially indicated by the Constitution. Besides the subject matter, a federal constitutional law requires a qualified majority in both chambers of the federal parliament in order to be passed. The most important of such laws regarding public administration is the Law No. 2-FKZ dd. 17 December 1997, "On the Government of the Russian Federation." It provides for the composition of the RF Government, its powers, and relationships with federal ministries and other executive bodies, as well as with the regional governments, for the distribution

of functions between members of the RF Government, as well as for financial and logistic support for the RF Government and its members (see chapter ▶ "Federal Government, Russia"). Besides, federal constitutional laws No. 3-FKZ dd. 30 May 2001 "On the State of Emergency" and No. 3-FKZ dd. 30 January 2002 "On the State of Martial Law" are considered to be significant sources of administrative law, although neither of them were ever applied.

Unlike federal constitutional laws, ordinary federal laws are numerous statutes that can be passed on the issues of both federal and joint jurisdiction with approval by simple majority of the federal parliament. Among these the RF codes should be distinguished. These are the statutes that belong to the category of federal laws as regards parliamentary procedures and the hierarchy level within the system of the sources of law. Yet they are recognized as the key federal statutes that are destined to lead the respective legislative branch. However, unlike some less complicated branches of law, the administrative law does not possess a single leading code but distributes its provisions among a number of the RF codes and thousands of other federal laws. Most noteworthy of the RF codes related to the administrative law are the following: Budget Code of 1998, Tax Code of 1998–2000, Code on Administrative Offenses of 2001, Inland Water Transportation Code of 2001, Land Code of 2001, Urban Development Code of 2004, Forest Code of 2006, and Water Code of 2006.

Besides, in 2015 the Code of Administrative Court Procedures had been passed. Depending on the point of view, it can be regarded either as one of the crucial sources of the RF administrative law or as a source of the RF law of administrative procedures, separate from the RF administrative law.

Apart from the national codes, a single supranational one exists since 2017. That is the Customs Code of the Eurasian Economic Union. That is, surely, not a unique supranational source of the RF administrative law but definitely the only one that had been favored with the title of a code. In fact, it deserved this title, as far as it replaced the content of the customs legislation of the Union members.

Outside the codes ordinary federal laws cover various matters of public administration. As stated above, usually they contain provisions that belong to several theoretical branches of law. This fact permits the scholars to regard such statutes as the sources of administrative, constitutional, municipal, financial law, etc. simultaneously. Yet, this multibranch nature of federal laws does not impede defining many of them as particularly important sources of administrative law. Among these the following ones ought to be mentioned:

- The statutes governing relations of individuals with the executive (namely, federal laws No. 62-FZ dd. 31 May 2002 "On the RF Citizenship," No. 114-FZ dd. 15 August 1996 "On the Procedure for Leaving from the Russian Federation and Entry into the Russian Federation," No. 115-FZ dd. 25 July 2002 "On the Legal Status of Foreign Citizens in the Russian Federation," No. 109-FZ dd. 18 July 2006 "On Migration Registration of Foreigners and Apatrides," RF Law No. 5242-1 dd. 25 June 1993 "On the Rights of the RF Citizens to Freedom of Movement, Domicile and Residence Choice," etc.)
- The statutes setting administrative rules for business undertakings (namely, federal laws No. 294-FZ dd. 26 December 2008 "On the Protection of Legal Entities and Sole Proprietors in the Exercise of Government Control," No. 99-FZ dd. 4 May 2011 "On the Licensing of Certain Types of Undertakings," No. 173-FZ dd. 10 December 2003 "On Currency Exchange Regulation and Control," No. 183-FZ dd. 18 July 1999 "On Export Control," etc.)
- The statutes on some federal and regional executive bodies (namely, federal laws No. 403-FZ dd. 28 December 2010 "On the RF Investigative Committee," No. 40-FZ dd. 03 April 1995 "On the Federal Security Service," No. 184-FZ dd. 6 October 1999 "On the General Principles

of Organization of the Legislative (Representative) and Executive Bodies of the RF Constituent Entities," etc.)
- The statutes related to public service (namely, federal laws No. 58-FZ dd. 27 May 2003 "On the System of Public Service in the Russian Federation," No. 79-FZ dd. 27 July 2004 "On the RF Civil Service," No. 53-FZ dd. 28 March 1998 "On Military Duty and Military Service," No. 76-FZ dd. 27 May 1998 "On the Status of Military Personnel," No. 161-FZ dd. 12 July 1999 "On Material Liability of Military Personnel," No. 3-FZ dd. 07 February 2011 "On the Police," No. 342-FZ dd. 30 November 2011 "On the Service in the RF Internal Affairs Agencies, etc.)
- The statutes governing administrative operations (namely, federal laws No. 210-FZ dd. 27 July 2010 "On the Public Services Provision," No. 59-FZ dd. 02 May 2006 "On the Procedure for Considering Applications from the RF Citizens," No. 129-FZ dd. 8 August 2001 "On the Government Registration of Legal Entities and Sole Proprietors," No. 170-FZ dd. 01 July 2011 "On the Technical Inspection of Vehicles," No. 218-FZ dd. 13 July 2015 "On the Government Registration of Real Assets," No. 31-FZ dd. 14 March 2009 "On the Government Registration of Aircrafts and Dealing in Them," etc.)
- The statutes setting quantitative and qualitative standards (namely, federal laws No. 184-FZ dd. 27 December 2002 "On Technical Regulation," No. 412-FZ dd. 28 December 2013 "On the National Accreditation System," etc.)

Under the RF Constitution, administrative legislation belongs to the huge sphere that is formally called joint jurisdiction of the Russian Federation and its constituent entities. However, the name "joint" is not completely adequate to the legal nature of this sphere. In fact, it would be more precise to designate it as concurrent jurisdiction (Leksin and Seliverstov 2017). The scope of federal legislation within this sphere has no fixed limits. The Federal Assembly is not obliged to leave room for the regional legislation on any matter of the joint jurisdiction. Consequently, regional parliaments cannot compete with the federal one in lawmaking as equals. However, within the sphere of public administration, there remain huge areas where the regional legislatures enjoy considerable discretion.

Every of the 85 RF constituent entities passes its own legislation regarding almost all public administration issues indicated above (a noteworthy exception is establishing court procedures that are totally controlled by the federal legislation). Due to the great number of constituent entities, regional laws taken as a whole outnumber federal ones passed on the public administration issues by 20 to 1. The system of statutory sources of administrative law varies from one region to another, as every regional government decides independently whether to pass a codified statute covering a number of relative issues or to enact several separate laws and bylaws. However, one can observe considerable interregional regularity as well.

First, all regions have their own legislation, as well as much more numerous bylaws on the formation and composition of the executive branch of government; on the distribution of powers and responsibilities between the ministries, departments, agencies, inspections, committees, and other bodies established by the respective legislator, by the governor, and by the higher regional executive body (the council of ministers, the administration, etc.); and on the public services provided by these bodies. In lawmaking on these issues, regional parliaments have to follow some federal guidelines of rather constitutional than administrative nature. Namely, these are the federal provisions concerning election and impeachment of the governor, the list of his powers and responsibilities, his relations with the higher regional executive body (or the governor's position within the latter), and common functions of the latter (see chapter ► "Regional Executives, Russia").

Second, every RF constituent entity legislates upon its civil service. However, regional laws on this issue are not very creative. As a rule, regional legislatures borrow structure and phraseology

from the Federal law dd. 27 July 2004 "On the RF Civil Service."

Third, the RF constituent entities pass their own statutes or codes or laws on administrative offenses. Many categories of the violations of this kind are covered by the RF Code on Administrative Offences, so regional legislation deals with the punishment for such violations as breaches of peace and quiet at nighttime and on rest days, breaking the rules of sanitary control within settlements, of refuse collection, of snow cleaning, nonpayments for commuter services, etc.

Altogether, on federal and regional levels, the statutes containing administrative provisions are estimated in dozens of thousands. However, bylaws being issued by federal and regional administrative bodies exceed this number a hundredfold. Among these bylaws are the decrees of the RF President; resolutions of the RF Government; orders and other regulations issued by federal ministries, agencies, and oversight bodies; as well as the documents passed by similar regional bodies.

The RF President above all has the power to define the structure of the federal executive. Actually, almost all current federal ministries, agencies, and oversight bodies had been established by his decrees. Besides, he sets the criteria for the regional governments' performance evaluation. In addition, he determines the composition and functions of dozens of administrative and consultative bodies, including five ministries (Ministry of Foreign Affairs, Ministry of Home Affairs, Ministry of Defense, Ministry of Emergencies Management, and Ministry of Justice). The President has also broad regulating jurisdiction regarding civil, military, and law-enforcement service. Namely, he is responsible for approving the register of the federal civil service offices, the list of standard regional civil service offices, and the guidelines for the qualification requirements at the civil service, establishes procedures for the civil servants' qualification tests, defines the salaries of the RF civil servants, enacts the requirements for official conduct of the RF civil servants, lays down the rules for settling conflicts of interest, issues army and police regulations, etc.

The RF Government issues bylaws governing economics, social policies, science and technological development, education, healthcare, power engineering and power supply, transportation, housing, as well as some issues of law enforcement. For instance, it determines the composition and functions of most federal executive bodies; issues tariff regulations, road regulations and rules for the federal property management, for distribution of social support, and for assigning subsidies and subventions from the federal budget; defines the unemployment benefit; establishes procedures for conducting technical inspections and examinations, as well as for federal licensing, certification, accreditation, and attestation, for the government purchases, for applying protective measures and out-of-court restraints, and for the regional governments' performance evaluation; establishes federal institutions and enterprises; and approves federal programs.

Separate ministries, agencies, and oversight bodies issue instructive documents that particularize the guidelines issued by the RF President and the RF Government and pass numerous administrative regulations covering procedures for providing various public services, for performing state duties, and for conducting intergovernmental and intragovernmental interaction.

As mentioned above, regional governors, councils of ministers, administrations, ministries, departments, and other bodies issue normative decisions as well (see chapter ▶ "Regional Executives, Russia").

On the overall administrative law is considered to be imperative by its nature. However, within the sphere of public administration, one can find some space for agreement-making as well. Thus, unilateral decisions coexist with bilateral and multilateral regulation (see chapter ▶ "Administrative Intergovernmental Agreements, Russia").

## Administrative Law and Russian Judiciary

Unlike many civil law countries, Russia does not have a system of administrative courts.

A protracted argument regarding establishing such specialized institutions came to almost nothing. The mentioned Code of Administrative Court Procedures had been passed in 2015, but that did not imply the institutional changes in the Russian judiciary. As before, multifarious bodies and officials adjudicate in cases of administrative offences, settle administrative disputes, and deal with complaints against administrative decisions. Most typical administrative violations belong to the jurisdiction of numerous executive bodies at both federal and regional levels of government. Regular courts consider administrative disputes and try significant cases of administrative violations committed by individuals, while commercial courts (literally called "arbitration courts") deal with administrative violations imputed to legal entities and sole proprietors.

Notwithstanding the lack of specialized administrative courts, judiciary plays a considerable role in the formation of the RF administrative law. They have already made substantial contribution to the RF administrative law through interpretation and transformation of the federal and regional legislation. The RF Constitutional Court had taken a number of marked decisions regarding the formation of the RF Government, the structure of federal executive, as well as compliance of the RF Code of Administrative Offences with the RF Constitution (see chapter ▶ "Constitutional Law and Public Administration, Russia"). The RF Supreme Court's decisions are more focused at the issues of administrative offenses and public services.

## Conclusions

Administrative law is undoubtedly the main container for the rules regarding public administration. Yet, the borders of this branch of law are vague and disputable. However that may be, no one recognizes that the legal rules that govern public administration issues can be reduced to the provisions belonging to the administrative law. The latter shares this role with the set of adjacent branches of law. The list of the latter is also a matter of discussions. Nevertheless, against the background of average-size branches of law, the RF administrative law looks like a superbranch. It possesses a wide variety of regulative tools that allow to permeate through every nook and cranny of public administration. Statutes and bylaws remain most common of these tools, though administrative agreements are also in demand. Besides, although Russia is popularly considered to be a part of the civil law system, court decisions play a constantly increasing role in the considered sphere.

# Administrative Law Judges and Politics

Benjamin Kassow
Department of Political Science and Public Administration, University of North Dakota, Grand Forks, ND, USA

## Synonyms

ALJs; Judges of Specialized Jurisdiction; Social Security Administrative Law Judges

## Definition

An administrative law judge (ALJ) is a trial court judge that resolves claims/disputes involving administrative law within certain agencies (federal or state, depending on the particular judge).

## Introduction

A standing debate in American politics and the role of bureaucrats within American politics involves the role of administrative law judges: are they bureaucrats or are they traditional judges? While the jury is still somewhat mixed, Taratoot and Howard (2011) find evidence that the role of an administrative law judge (ALJ) encompasses both bureaucrats and judges, at least with regard to the National Labor Relations Board (NLRB). On the one hand, ALJs are employed as bureaucrats and are encouraged to help ensure that individuals comply with federal agency regulations. On the other hand, the fact that an ALJ is a judge mandates that ALJs have some degree of independence from interference from other political actors. In order to begin to answer this question, one needs to know about the role of ALJs in society more generally, as well as to understand how they came about, as well as their functions and organization, both at the federal and state levels.

In this entry, I discuss the following things: who administrative judges are and their role in federal government, the history of ALJs in the US federal government, evidence on the degree that ALJs act (and/or have the ability to act) politically, and conclude with discussion with administrative law judges at the US subnational (i.e., state) level. I ultimately conclude that the power of ALJs is relatively extensive (if not absolute); I describe evidence that suggests that ALJs have the ability to act politically much of the time, and often do act politically, and describe recent changes to state ALJs that encourage increased levels of professionalism and independence among ALJs in states.

## Who Are Administrative Law Judges? What Do they Do in the Federal Government?

Evidence is in fact fairly clear that ALJs share characteristics with both bureaucrats and federal judges. Similar to bureaucrats, they are employed through the Office of Personnel Management (OPM) and must pass civil service exams to obtain the job and to receive various types of promotions; these are done to ensure that ALJs are qualified and understand the legal areas that they will be ruling on. The requirements include both a 4-h written examination and an oral examination. On the other hand, compared with bureaucrats who generally are paid through the agency that they work for, ALJs actually get paid and promoted through the Office of Personnel Management. In some regards, this is quite useful for increasing an administrative law judge's political independence, as it ensures that these judges are not able to be fired or have their pay reduced by the particular agency that they work for (Taratoot and Howard 2011, p. 835).

An important implication of the fact that ALJs are not hired by the agency is that they are actually merit-appointed-based judges and serve a unique role in the United States by virtue of

being selected purely on the basis of merit. In fact, this makes ALJs more akin to civil law judges in a comparative perspective, where judges are generally given a code to apply to specific sets of cases and are promoted primarily via a merit-based, test-based system. Consequently, this similarity to civil law judges makes administrative law judges unique in the US perspective.

Also, importantly, decisions by administrative law judges are not reviewed directly by an Article III court (generally a US court of appeals three-judge panel but this depends on the federal agency) (see Ringquist and Emmert 1999), but, rather, are reviewed by an agency head (or commission), which then gets reviewed by some type of Article III court. As a result, this puts ALJs in a position where they are not directly held accountable by an Article III court but whose decisions can be directly overturned by a commission (or agency head, depending on the particular agency that an ALJ is working in). However, similarly to an Article III judge, the agency head cannot remove an ALJ, unless an ALJ is being fired for cause, which can additionally be reviewed by a US district court judge. In practice, this arrangement gives quasi-lifetime protection to administrative law judges in a way that many other judges, who are part of an Article I tribunal (this includes ALJs), do not. This system is in contrast to that of magistrates or bankruptcy judges, who served fixed terms (bankruptcy judges and magistrates serve 14-year terms).

ALJs, in the US constitutional perspective, are considered to be Article I judges (created by legislature rather than created directly by virtue of the Constitution, as is the case for Article III judges), although ALJs have a relatively large amount of freedom from political interference compared with many other types of Article I judges. ALJs, in particular, have a role that is similar to that of a US district court judge, where an ALJ has the power to rule of the admissibility of evidence, regulate all administrative hearings, and make decisions regarding claims against an agency, although they do not generally have the power to forcibly sanction an agency (unless Congress specifies otherwise). If an ALJ was to recommend a sanction or enforcement against an agency, the case would go to a US district court, for full adjudication.

The federal government has approximately 1800 ALJs across 24 separate agencies (FedScope 2012), although the Social Security Administration has a majority of these 1800 ALJs in the federal government. Most agencies, specifically, only have several dozen ALJs working at a given time, although they can request additional ALJs, on a temporary basis (up to 6 months at time), from the Office of Personnel Management. The role of an ALJ is to serve as an independent arbiter in adjudication. Unlike Article III (and most other Article I) judges, administrative law judges also have the ability to rule on hypothetical cases, or ones that do not constitute "cases and controversies," in an Article III definition. This gives administrative law judges a unique ability to shape law in an especially large way, as it allows administrative law judges to make rulings on a variety of administrative-related issues. On the other hand, administrative judges do not have the ability to overrule decisions made by either the legislative or executive branch (Baum 2009; Moliterno 2006).

According to sections 553–559 of Title V in the US Code, in order to be an ALJ, a candidate must be able to comply with the following requirements: (a) must be a licensed attorney who has passed the bar exam in a state, in the District of Columbia, or in Puerto Rico; (b) must have 7 years of active experience as a trial attorney in litigation and/or administrative law; and (c) must pass an exam relating to the duties of an administrative law judge. Interestingly, these requirements are more than that for most Article III judges and are similar to that of other specialized judges (regardless of Article III or Article I-based specialized judges). In effect, what this means is that ALJs are likely to have high levels of experience and a specialized skill set in administrative law (Miller and Curry 2009, 2013). This effect may have other important

implications with regard to judicial behavior, which is mostly, as of now, unknown (Baum 2009).

## Political History of ALJs

The idea of an administrative law judge initially came into existence in 1946, with the passage of the Administrative Procedures Act (APA). The APA specifically designates that administrative law judges are to be hired and promoted in terms of pay and responsibilities, via a merit-based system, thus making them (uniquely) the only set of judges in the United States that are hired and promoted based primarily on a merit-based system. The primary reason that Congress set up administrative law judges to work this way in the APA was the fact that they would be working primarily for an institution, rather than for a particular presidential administration. In so doing, Congress sets up ALJs to be a quasi-independent part of the executive branch but that could only be removed by a president or an administration for proper cause.

What the 1946 APA does, which is quite innovative with regard to bureaucratic administrations, is it creates two types of agency actions: rulemaking (quasi-legislative) and adjudication (quasi-judicial). The importance of this split is that the quasi-judicial portion or the ALJs are responding primarily to requests regarding the application of agency rules, rather than primarily ruling on larger statutory or constitutional questions, although their decisions do have real-world impact on public decisions, such as enforcement of various types of policies, including energy policy, environmental policy, as well as the distribution of social security benefits, among a variety of other things.

More recently, ALJs have received more de facto power, as their role has changed to some degree. At least at the federal level, many ALJs are dealing with benefit and enforcement of regulation cases that occur almost like that of a trial against the US government. While this has enhanced the power of ALJs, as Skoler (1982) notes, this has also made the position somewhat more problematic in a normative sense, in that their decisions are more likely to be final.

## Evidence Regarding ALJ Decisionmaking

While relatively little evidence exists regarding the degree that administrative law judges act politically with regard to the decisions that they make, some evidence does exist. Notably, Taratoot (2014) finds evidence suggesting that ALJs respond to cases in a similar manner to that of Article III federal district court judges, in that they are influenced in some degree by ideology but are primarily influenced by other factors, including characteristics of litigants, as well as facts related to individual cases. In one regard, this is somewhat surprising in that administrative law judges do not have complete independence as they are Article I judges, although they do have a greater degree of independence from the agency that they work for compared with most Article I judges, given that they are not employed through the agency itself.

In many cases, given the language regarding statutes that ALJs frequently must interpret, Taratoot (2014) speculates that ALJs actually have substantial independence regarding their interpretation of administrative procedure and congressional statutes that relate to specific agencies they are designated to work on. However, because ALJs are at least part bureaucrat, Congress also has substantial ability to constrain ALJs if they choose to do so. Because ALJs have the freedom to rule on cases and are difficult to remove from their positions unless for cause (which is not defined by Congress), they likely have more of an ability to act "politically," at least in a theoretical sense, compared with other types of judges.

Also importantly, evidence also exists that may be unusual for federal boards to routinely overrule ALJ decisions (Taratoot 2013). Specifically, Taratoot finds, while examining decisions made by the political appointees of the National Labor

Relations Board, that the decision made by an ALJ is much more likely to determine the outcome of an appeal to the political board, compared with the board members' ideology. He finds these findings to hold regardless of whether the decision being reviewed is an "easy" decision or a "difficult" decision, denoted by a combination of whether the full political board hears an appeal, as well as cases that "involved novel questions or set precedents that may be of substantial importance in the future administration of the Act" (Cooke et al. 1995, p. 247). What Taratoot finds specifically with regard to the NLRB is that approximately 66% of ALJ decisions are completely affirmed, whereas approximately 16.5% are reversed (with 17% partially modified). Thus, it can be said that while the board is not simply a "rubber stamp" for an ALJ, it does not generally have an inclination to overrule the ALJ's ruling either. Future work should examine the degree to which boards at other federal agencies (that have ALJs) have similar types of results in this regard.

Yet, in some regards, at the same time, there are reasons to potentially expect that ALJs may be restricted, at least in some cases. Unlike Article III judges, their decisions do get reviewed from within the executive agency itself (Moliterno 2006), which serves as some degree of a check against the agency.

## State ALJs

Similar to the state and federal dual systems of judiciaries, many states also have their own administrative law judges, as a part of state administrations. Like the fact that state courts vary highly in terms of professionalization as well as in the degree of independence that state court judges have, state ALJs vary significantly in terms of their ability to make independent decisions. In some states, such as California, the setup of ALJs is quite similar to that of the federal government, where ALJs are part of an agency but are employed and paid by a state agency similar to that of the OPM, in the federal government. On the other hand, other states, such as New Jersey, use a "central panel agency," where administrative law judges serve all agencies within a state rather than being assigned to an individual state agency to work for. Very little is known about the degree that state ALJs behave politically, but given the research on state courts that finds large differences in political behavior among state high court justices, there are reasons to suspect that differences among institutions with regard to ALJs may similarly encourage (or discourage) varying types of political behavior.

As Hoberg (1994, 2001; see also Flanagan 2005) notes, a central agency is a group of ALJs that are employed by a central office that preside over agency proceedings on as "as needed" basis. What this effectively means is that the agency gets ALJs that are appointed by a group other than the agency (similar to the federal system) that allows an ALJ to be impartial and to not worry about potentially being fired from her position if she rules against the agency, as she would not be hired by the particular agency that she would be working for (see Levinson 1981).

Some evidence exists suggesting that central panel judges may be especially effective for state administrative law judiciaries for several reasons from a theoretical perspective. First, they provide an extra check against the firing of administrative law judges at the state level, who do not necessarily have the same level of protection as in the federal bureaucracy (Felter Jr 2001). Rather, in most states that use central panels, there is a panel of judges that examine state ALJs on a performance-based metric, with the ability to fire ALJs that are not performing acceptably. This performance evaluation is completely separate from the frequency that the ALJ rules in favor of (or opposed to) any particular agency that the judge is ruling with regard to. In other cases, states actually make an ALJ's decision final (Flanagan 2005), where an agency has minimal ability to overrule an ALJ's decision. On the other hand, in many instances, state make it easier to remove a case from a state administrative agency directly to an elected state judge (or federal judge in some instances) compared with the feasibility of doing so in a federal agency, where one must exhaust all

appeals within an internal agency before going to an actual Article III court for adjudication.

## Conclusion

In conclusion, while much is still unknown about the degree that administrative law judges act politically, what current evidence exists suggests that across a variety of agencies, ALJs have the ability to act politically, both in terms of their own political viewpoints, as well as acting strategically toward a variety of other actors (the board that receives appeals from the ALJ, as well as the US courts of appeals), which suggests that ALJ decisionmaking is relatively similar to that of US district court judges and magistrates, who make a variety of decisions regarding the admissibility of evidence, as well as making direct decisions in some criminal cases (i.e., those that involve a bench trial), as well as all initial federal civil cases (except for those that qualify and receive a jury based on the Seventh Amendment – roughly 3% of those eligible cases do receive a jury) (see Klein 2002; Baum 2006, with regard to court of appeals judges).

Of equal importance is the idea that an ALJ's decision has a reasonable probability of surviving review by a political board. This suggests that an ALJ's decision has real "teeth" and is not hugely likely to be overruled. More specifically, this means that an ALJ's decision has a reasonable probability of being final with regard to the interpretation of an administrative rule or a remedy to a violation of an administration rule. This finding is likely true both at the federal and at the state level, meaning that ALJs are becoming increasingly professionalized and relied on across several layers of the judiciary. In short, the importance of ALJs and the potential for ALJs to act politically may increase over time, as they become more professionalized (Baum 2009; Squire 2008). Finally, the role of ALJs seems to be shifting in states to a more professionalized form of ALJ, giving administrative law judges a greater ability to act politically in the future, similarly to the discussion given to federal ALJs.

## Administrative Politics and Lobbying Regulation

Direnç Kanol
Public Administration Department, Near East University, Nicosia, Northern Cyprus, Turkey

### Synonyms

Accountability; Advocacy; Good governance; Policy influence; Political equality; Public integrity; Public interest; Regulatory capture; Transparency

### Definition

Lobbying regulation is a combination of rules set up for organized interests which then they must follow when trying to influence public policy.

### Introduction

How a society is governed differs widely based on the political system of a country. Political scientists differentiated between democratic regimes, authoritarian regimes, and those which fall in between hybrid regimes. There are also different types of executive-legislative relationships in different countries. The basic differences being among parliamentary, presidential, and semi-presidential regimes. Public administration scholars have their own contribution to classifying governing styles: governing with traditional (bureaucratic) tools, business-like New Public Management (NPM) instruments, Neo-Weberian, or public value oriented governing instruments. Despite differences in each of these styles of governance, what is common among them is that a government must find ways to properly interact with nongovernmental actors. These nongovernmental actors can be corporations, business associations, workers' unions, or nonprofit organizations striving to further the public interest. The degree and style of interactions between governmental and nongovernmental actors can change in each governance structure; however, non-state actors' importance in governance cannot be underestimated in any political system.

The question to ask, then, would be: What are the consequences of outside interests participating in public decision-making processes? Participation of outside interests into policy-making mechanisms can be desirable. Interest groups represent an array of citizens and organized interests possess expertise which might not be in public actors' possession. However, concerns remain about the unequal power of different non-state actors. In fact, many citizens believe that wealthy companies own the policy processes, hence, destroying the very essence of political equality which is a necessary condition for any type of democratic regime. Moreover, citizens, some nonprofit organizations, and some political parties lament the lack of transparency in how organized interests influence decision-making structures. Different policy instruments might be available for governors to address the concerns of citizens about opaque and excessive influence of some groups in governance.

Recently, democratic countries have turned to lobbying regulation as one of these instruments. Lobbying regulation means setting up rules for organized interests which then they must follow when trying to influence public policy. These rules can be one or more of the following: registering the influence seeker's name on a public register, stating whom and/or which organizations the influence seeker is talking to, about which policies the discussions take place, specifying the amount of financial resources put into lobbying activities, banning exchange of gifts between lobbyists and public actors, and regulating the public actors' post-employment practices (e.g., banning public actors from being employed as a

public affairs professional for a certain amount of time, also known as "cooling-off" period).

Lobbying regulation used to exist in only a handful of countries. The USA, Germany, Australia, and Canada experimented with lobbying regulations in the 20th Century. With the rise of anti-politics sentiment, an increased interest by international institutions like the Organization for Economic Cooperation and Development (OECD), and attempts to engineer lobbying regulation at the European Union (EU), lobbying regulation policy started to diffuse from country to country, especially in Europe. Because of this fast pace of policies developing and evolving, the most comprehensive study on global lobbying regulations written by Chari et al. (2010) has already been outdated. This chapter briefly presents what is currently known about lobbying regulations so far, and what this knowledge implies for their usefulness in good governance.

## Regulating Lobbying: The State of the Art

Comparative research measures the strength of lobbying regulation in different contexts, albeit with mixed results. The stringency of lobbying regulation in the USA has served as a model for other polities. The length of time in experiencing with lobbying regulation, the number of lobbyists functioning in the pluralist system, the unchecked power of lobbyists and the various problems faced due to this unchecked power might be part of the reasons why the USA has established a strong regulatory system for lobbyists. It should be noted that self-regulation or voluntary registering schemes used by the European Commission should be discussed separately than lobbying regulations. Regulatory policy defines the rules of a game, and thus, societal actors must comply with these rules. Therefore, to say that a polity has lobbying regulation, that polity needs to have mandatory rules for lobbyists to follow.

Researchers provide explanations to why lobbying regulations exist in some contexts but not in others, or why lobbying regulation is more stringent in some contexts than in others. On the whole, political scandals and policy diffusion together are mainly responsible for such variations (Crepaz 2017). Political scandals about public actors granting favors to outside interests in return for personal benefits occupy a high place on the media's agenda. This, in turn, captures the attention of the public and destroys the positive image of politicians and public administrators. Lobbying regulation policy, then, immediately becomes a topic of discussion in the government and among the legislators. Agenda-setting is also influenced by international institutions suggesting benchmarks for integrity in lobbying. Policy formulation and adoption stage is highly influenced by examples in other countries. Good practices might diffuse from one country to another or policy-makers might selectively pick some parts of the policy in another country and leave others out.

Arguably, the most intriguing question for scholars and practitioners alike is if lobbying regulations work. To answer this question, first a consensus is needed on what lobbying regulations aim to achieve, and then observe their effect on these desired outcomes. At the same time, it is imperative to investigate if there are any unintended consequences of lobbying regulation policy. The aim of lobbying regulation is to have transparency, accountability, political equality, and integrity around the influence of non-governmental actors on public policy. Transparency is the main driver of these desirable outcomes expected from regulating lobbying. Transparency is needed because of public suspicion about what takes place behind closed doors. The public should first know who influences whom, when, and how. Only then can they hold public actors accountable, and only then can they react to excessive influence by a few wealthy groups on public policy. Organized interests would be more inclined to lobby responsibly if they know that the public can investigate their actions. "Cooling-off" periods can curb the inclination towards acting irresponsibly while in public office or using contacts to influence public policy in favor of certain groups as soon as public officials leave their post and get a public affairs position in a private company or an interest group.

Current knowledge about the impact of lobbying regulations is still limited. Overall, one might be cautiously optimistic about lobbying regulations achieving their desired aims. In the USA, the Honest Leadership and Open Government Act which became law in 2007 managed to curb the number of legislators turning lobbyists (Cain and Drutman 2014). The stringency of lobbying regulations in American states is correlated with both overall interest group influence in legislatures (Ozymy 2010) and political equality (Flavin 2015). Moreover, experimental data shows that when people are exposed to information about lobbying regulations, they become less cynical towards the government (Kanol 2018). However, in the EU, stakeholders mainly questioned the effectiveness and sustainability of lobbying regulation (Bunea, 2018). One should, however, emphasize that the EU is in the process of adopting a mandatory regulatory lobbying system, and thus, it is too early to evaluate if that new regulatory system will be an effective one. There is, also, an unintended consequence of regulating lobbying, which is red tape. Lobbyists must enter all information into a public register which is then managed by public officials. These public officials are responsible for checking irregularities in the data and act accordingly. Enforcement is as important and difficult, if not more, as designing sound lobbying regulation policy. Both lobbyists and public administrators need to spend significant time and effort to function in this regulatory system efficiently. Therefore, it might be expected that stakeholders might develop negative feelings towards lobbying regulations.

## Conclusion

Lobbying regulation policy is necessary for the public to gain knowledge about outside influence on policy-making and set preventive rules against lobbyists acting against the public interest. To an extent, this might prevent influence peddling behind closed doors and undue influence by some groups. Recently, political scandals and policy diffusion have triggered discussion and adoption of lobbying regulation in various countries. As countries experiment with regulating lobbying, the knowledge about the effectiveness of lobbying regulation is expected to consolidate. The limited number of research on the effect of lobbying regulations until now might suggest that the jury is still out. However, the preliminary knowledge suggests that they have, on average, produced positive results.

Multiple administrative challenges exist for both top-level and street-level bureaucrats to implement the rules defined by lobbying regulations. Administrative burden, however, is a by-product of almost all regulatory policies. The trade-off between creating rules for "fixing" lobbying practices and administrative burden should not occupy the minds of regulators who are distressed with the legitimacy crisis in representative democracies. When designing lobbying regulation, policymakers should also consider how it would work together with political finance regulation. Political donations provided by private actors are also a means of influencing public policy. Therefore, it can hardly be separated from lobbying. Policy success can be disrupted by discrepancies with or deficiencies in political finance laws.

Advanced democracies are in the process of creating democratic innovations to tackle the challenge of cynicism towards politics and populism. In the near future, it is reasonable to expect to see mandatory rules for lobbying in almost all democratic countries as a part of these democratic innovations. One should not perceive these rules to be a panacea for corruption. If private actors decide to bribe public actors, and if the latter goes along with it, lobbying regulation can hardly prevent this. However, lobbying regulation creates transparency and induces ethical practices which decrease the likelihood of opaque, chaotic, and highly unequal system of influence production. Therefore, it should be understood as a policy which is an indispensable part of good governance.

# Administrative Politics: Context, Roles, and Process

Richard C. Box
University of Nebraska, Omaha,
Omaha, NE, USA

## Synonyms

Administrative discretion; Bureaucracy; New public governance; New public management; Politics-administration; Principal-agent

## Definition

Administrative politics addresses the role of public administrators in a democratic society. This role is embedded in an institutional context in which administrators, elected leaders, and the public advocate for particular goals, principles, or decision-making processes in government.

## Introduction: The Societal Context

The term "administrative politics" may seem an awkward combination of words, if one assumes that public-sector administration should be shielded somewhat from things political. The realities of practice and a considerable body of research have shown, however, that the politics-administration relationship is a matter of emphasis rather than clear separation, a continuum rather than a dichotomy.

For the purposes of this chapter, politics can be defined as activities in which people advocate for particular goals, principles, or decision-making processes in government. The phenomenon is not limited to parties, elected officials, and political appointees, but is also found in the administrative hierarchies of public agencies. In the typical "overhead" model of democracy, the people elect leaders and representatives who make policies and direct the activities of career

professionals employed to implement them. Authority runs downward in the hierarchy, accountability runs upward, and the legal mandate for making policy rests at the top.

In this model the public will is expressed only by elected leaders, whose legitimacy in doing so is gained through election. In practice, the model fails to recognize that unelected public professionals, chosen for their demonstrated abilities rather than political loyalty, learn much about public needs and preferences in their daily work. They use this knowledge to adjust operating procedures and to recommend new policies and changes to existing policies, so they share with elected leaders the function of representing perceived public will in the policymaking process.

Scholarly writing on politics in bureaucracies often focuses, understandably, on elected leaders and their political appointees. This is important, but these people are a small percentage of all those who work in government. Instead, this chapter focuses on politics involving career professionals. This includes intraorganizational politics in which public professionals interact with elected officials and political appointees, as well as extraorganizational relationships with other units of government, citizens, interest groups, businesses, and nonprofit organizations.

The legal authority for funding and evaluating the performance of administrative agencies rests with elected leaders. As a result, the behaviors of public professionals will be affected by what they believe to be the preferences of those leaders, preferences that are influenced by public opinion, economic conditions, and other factors. In addition, the work of public professionals will be affected by what they believe to be the preferences of individuals and organizations outside the agency hierarchy.

In these ways, the political and economic context of society shapes the work of public professionals. The societal context includes periods of economic downturn, heightened public dislike of bureaucracy, and legislative or executive desire to shrink government. When such trends occur, they can produce pressures for cost cutting, structural reform, or changes in policy and mission that impact the goals and priorities of public agency staff. The societal context also includes periods during which there is public demand for greater public-sector activity to deal with current societal problems. At these times, public agencies grow and public professionals experience opportunities to create new initiatives.

It is in this setting of structural constraints on bureaucracy; the complexities of interacting with a variety of people, groups, and organizations; and the effects of conditions in the societal environment that this chapter examines aspects of administrative politics. The narrative is divided into two substantive sections, addressing the effort to control bureaucracy and the exercise of administrative discretion. The conclusion draws together concepts from these two sections and highlights implications for public administration theory and practice.

## Control of Bureaucracy

Bureaucracy as a form of human organization has a long history, but the modern study of bureaucracy is often dated from the writing of Max Weber in the early twentieth century. Weber's description of bureaucracy is an "ideal type," a means of describing bureaucracy as it would exist in a pure form. This description of a pure form can then be used to analyze the extent to which actual organizations differ from the image of the perfect bureaucracy. Weber's bureaucracy is characterized by strict hierarchy, maintenance of detailed documentation of an organization's activities, and workers who carry out their duties in a standardized, value-neutral fashion determined by the rules derived from adopted laws (Harmon and Mayer 1986). The characteristics of Weber's ideal type of bureaucracy parallel Woodrow Wilson's (1887) normative description from the late nineteenth century, in which he sought to differentiate the rational, businesslike operation of government from the turbulent and value-driven sphere of politics. For Wilson, government offices are set apart from political life, and bureaucrats serve as tools for implementation of the laws, not as participants in their creation.

Bureaucracy is generally recognized as necessary to the functioning of a modern society, but it can also be regarded as unruly or even dangerous. It is staffed by experts who may feel a sense of loyalty to the principles of democratic governance but not to the current regime. These people possess knowledge that is difficult for the public and elected leaders to understand, creating a problem of information asymmetry. In the several decades from the mid-twentieth century to the present, bureaucracies have grown so large and complex that citizens worry they are corrupt, too expensive in relation to services rendered, unresponsive to political or public will, or inclined to exert inappropriate control over the actions of political leaders.

Thus, it is not surprising that the study of government organizations in political science has focused on the theme of how to control the bureaucracy (Gruber 1987; Meier and O'Toole 2006, p. 23). The theme of control of bureaucracy has moved through phases. Into the 1940s, the supposed "politics-administration dichotomy" was the focus, featuring a clear separation of politics from administration. This was followed in the postwar era by "iron triangles" and "capture theory" in which federal agencies are influenced by private interests and by research on issues such as congressional oversight and budgeting (Wood and Waterman 1991).

### An Economic Perspective

Beginning in the 1980s there was a shift toward using economics-based "agency theory," in the form of "principal-agent" models, to describe relationships between political actors and bureaucracies. In this perspective drawn from the study of private-sector firms, the goal preferences of principals (major players in the policymaking process) such as members of congress, the president, political appointees, interest groups, and so on may differ from those of career bureaucrats, their agents. In addition, career professionals have knowledge of practices and conditions that some or all of the principals lack, creating a condition of information asymmetry. In this setting, principals may use forms of monitoring as a means of limiting "shirking," the extent to which bureaucrats engage in behaviors other than those preferred by principals (Moe 1984; Waterman and Meier 1998).

This shift toward use of economic concepts to study the control of bureaucracy had its roots in the development of "public choice" economics. In public choice theory, the economic assumptions of individual self-maximization and aggregated individual choice as the basis for collective action are imported from the private sector and applied to the public sector. In the post-World War II period, this approach was found in areas such as description of cities as market-like entities exhibiting packages of services and taxes to compete with other cities for new residents (Ostrom et al. 1961; Tiebout 1956), analysis of democratic decision-making processes (Buchanan and Tullock 1962), and description of bureaucrats as budget maximizers (Niskanen 1971).

In the field of public administration, the trend toward application of public choice theory in the public sector became especially evident in the 1980s. In the USA, the Reagan administration grounded its program of "supply-side" or "trickle-down" tax cuts for the wealthy on the ideas of economist Arthur Laffer. The "Laffer Curve" suggested that tax reductions for the wealthy would result in greater investment and economic growth and therefore increases, rather than decreases, in tax revenues, with more jobs and prosperity for everyone (Willoughby 2014, pp. 347–348). In addition, privatization of publicly provided services and contracting the production of public services to the private and nonprofit sectors were a focus of attention in the UK and the USA during the 1980s. Again, these concepts imported from the competitive private-sector market were consistent with public choice economics.

### New Public Management

In the 1980s, a loosely defined package of reform elements known as New Public Management became central to actions taken in several developed countries, including New Zealand, Australia, Sweden, and the UK. In broad summary, NPM included separating policymaking from the management of implementation,

emphasizing program outputs rather than inputs and process, using explicit measures of performance, introducing competition into service provision, using performance contracting and variable pay instead of fixed salaries for government managers, and shrinking the size of government (Hood 1991, 1995).

NPM spread to additional countries into the 1990s, including the USA. It took different forms in different nations; in some places the focus was on institution-level reorganization and decentralization of departments, and in others more attention was given to managerial issues such as performance measurement and contracting out services. In addition, the extent of adoption of features of NPM varied from nation to nation, with significant impact in some developed countries and little impact in others (Hood 1995). In the USA, the Clinton administration was inspired by the book *Reinventing Government* (Osborne and Gaebler 1993) to create broad reforms in the federal government that shifted attention from bureaucratic processes to a performance orientation. The reinvention version of NPM also emphasized organizations that would be mission-driven and entrepreneurial in the manner of a private firm and treat citizens as "customers," supposedly providing them with more choices and better service (Osborne and Gaebler 1993).

As might be expected with a model intended to replace traditional bureaucracy's order, process, and sense of serving the public interest with entrepreneurial government in the service of economic efficiency, NPM drew substantial criticism. Researchers observed that treating the clientele of the public sector as customers, delivering a pleasing interaction equivalent to purchasing a product from a private firm, ignores the fact that citizens want more than this from government. In a democracy, they expect to be able to play an active role in setting the public agenda, should they choose to do so (Schachter 1997). A related critique was that the customer orientation abandons a collaborative relationship between citizens and public administrators, making it difficult to sustain a substantive democracy in which the people participate in addressing issues such as social justice, environmental sustainability, and economic inequality (Box et al. 2001).

At the agency level, there was concern that the intraorganizational focus of NPM was poorly adapted to the contemporary governance setting of public organizations, which involves interorganizational and cross-sectoral relationships (Osborne et al. 2013). Also, to the extent public managers could be encouraged to act as market-like entrepreneurs, they might not be interested in values of fairness, justice, and accountability that are important to the functioning of public organizations (Terry 1998). Finally, using financial incentives to motivate public employees may not be effective in the public sector because public employees are more interested in an ethos of public service and the public interest (Rayner et al. 2011).

The concerns voiced in these critiques are reflected in changes made to some NPM initiatives. As an example, in New Zealand the business model of government was largely abandoned, the trend toward separation of policy and operational departments was reversed, and the size of the government workforce was increased to counter the loss of capacity that occurred when it was downsized at the beginning of the NPM initiative (Whitcombe 2008). Globally, adoption of features of NPM has been uneven, with recognition of the impacts of national political culture. Some leading nations in the global economy were slow to adopt NPM measures, suggesting this is not a universal paradigm sweeping the industrialized world (Hood 1995). NPM can also be problematic in authoritarian countries such as China; they are quite different from Western NPM-adopting nations in relation to professionalized bureaucracies, civil society, administrative processes, and fully developed market economies (Yang 2007).

### The Post-NPM Era

Though NPM did not become a universal global paradigm, it had considerable impact on public organizations. This can be observed in several areas of practice, such as an emphasis on performance measurement, improvements in budgeting,

greater attention to employment arrangements and incentives, and expanded use of the nonprofit and private sectors to deliver contracted services. The broader context of application of economic thought in the public sector continues. The metaphor "running government like a business" frequently expresses an expectation for government performance among political leaders and citizens, and the explanatory and normative attractiveness of principal-agent models is difficult to ignore once the politics-administration relationship is conceptualized in this fashion.

Meanwhile, attention in the research literature of public administration has shifted to the idea of New Public Governance (NPG). Despite use of the term "new," in some ways NPG represents rediscovery of concepts long present in the field. It focuses on interorganizational and cross-sectoral relationships, treating governance as a matter of service delivery systems in a networked environment (Koliba et al. 2011; Osborne et al. 2013). It returns attention to the role of public professionals in the policy process and recognizes members of the public in their roles as active citizens in addition to their status as consumers of public services (Osborne et al. 2013).

Several threads of NPG thought, including networks, citizen involvement, and administrative involvement in policymaking, can be traced well back into the history of public administration. Predictably, concerns about a polycentric governance environment have arisen, including insufficient democratic accountability, poor performance due to complexity, and excessive influence by political and economic interests (Koliba et al. 2011). Nevertheless, NPG may be thought of as a rebalancing following a period of single-minded focus on the market metaphor while acknowledging the effects of the market focus on the political environment of professional practice.

## Administrative Discretion

Control of bureaucracy is an institutional and organization-level perspective. It portrays public employees as objects to be manipulated for the purpose of maximizing compliance with the will of policymakers. While the concept of administrative discretion can operate at the level of institutions and organizations, it also examines the extent of each public professional's legitimate latitude of action, adopting the perspective of individuals who work in public organizations. The focus of administrative discretion is on how public professionals respond to demands from the political environment and the rationales they use in doing so.

A key point of beginning in the contemporary literature of administrative discretion is an exchange between Carl Friedrich (1940) and Herman Finer (1941), published just before the onset of World War II. They were debating the appropriate form of administrative responsibility in a democracy, an important issue then as it is now. Friedrich took the position that public administrators should shape the direction of public policy using technical knowledge, professionalism, and a sense of the needs of the public. Finer, in contrast, thought it is the duty of public employees to carry out the will of the people as expressed in policies adopted by their elected representatives. The opposing positions of Friedrich and Finer express a classic ethical dilemma of professional public service, captured in the question, "Whom do I serve, and for what purposes?" They also parallel the polar positions of trustee of the public interest and neutral implementer on the role continuum discussed below.

### The Role of the Administrator in a Democratic Society

The concept of administrative discretion may be thought of as an application of role theory (Biddle 1986).When a public professional considers options, makes decisions, and manages the consequences of acting, she or he is likely to be aware of constraints such as a constitutional system, subnational laws, administrative regulations and policies, personnel rules or a collective bargaining agreement, judicial decisions, and a job description.

Additional role constraints flow from the expectations for a professional's role held by people who have the capacity to influence or sanction

the professional for actions they believe are not role appropriate. These members of the "role set" include elected officials and political appointees; organizational superiors, peers, and subordinates; people in other public organizations; staff in nonprofit and private organizations with whom the professional interacts; staff in professional associations; and members of the public. A professional's role may evolve over time because of changes in external conditions, laws, policies, or organizational structure, the people with whom she or he interacts, or suggestions for change made by the individual professional.

If we imagine a continuum of the role of the public administrator in a democratic society, at one end is the traditional value-free, politically neutral implementer of adopted laws and policies. This model of the administrative role can be unrealistic because of the knowledge professionals accumulate in dealing with dynamic on-the-ground conditions, in addition to their specialized education and training. Career professionals often contribute meaningfully to constructive changes in policy and operations by giving feedback and making recommendations to organizational superiors and elected leaders.

At the other end of this role continuum is the public administrator who functions as a trustee of the public interest, taking into account the preferences of elected leaders as well as those of the courts, interest groups, and the public. This public professional may use normative preferences to advocate for changes in laws, policies, and operational procedures that serve general goals such as social justice, environmental protection, and rational decision making or goals related to professional specializations such as planning, environmental protection, law enforcement, social work, education, and so on. This model of the administrative role can be unrealistic because the public expects unelected public employees to be subordinate to elected leaders. While they may make their knowledge and expertise available to people with the institutional legitimacy to create public policy, they are not expected to direct or manipulate the decisions of elected leaders.

Most roles fall somewhere between the polar ends of this continuum. An individual's view of her or his role can shift over time, even during the daily process of considering alternative courses of action. When there are discrepancies between the professional's understanding of the role and the expectations of people in the role set, role conflict can occur, with possible realignment of the relationship between the individual and the organizational environment. As public professionals consider options in making a decision, whether in routine daily circumstances or in particularly challenging situations, the question of how to carry out the role of the administrator in a democratic society becomes especially relevant.

### Models of Administrative Discretion

The substantial body of research literature on administrative discretion may be illustrated with perspectives that occupy different positions on the administrative role continuum. Though there are differences between the perspectives described here, most lean toward the Friedrich/trustee position. While the bureaucratic control view of bureaucracy can be criticized for regarding public administration as a tool of implementation with little legitimacy in policymaking, the administrative discretion view is open to critique on grounds that it minimizes the importance of elected representatives in the legal and institutional order. It also tends to ignore the practical reality of employment, in which failing to perform one's duties as expected by elected leaders can have serious impacts on the careers of public employees.

The model of the administrator as steward of the public's business lies roughly equidistant between the polar opposites of the neutral implementer and the trustee of the public interest. Administrators who work in a stewardship mode go beyond functioning as a technocratic manager, taking responsibility for the justice of their actions and demonstrating an ethic of care for the people they serve (Kass 1990, p. 114). This can mean making independent judgments about the public interest that go beyond directives from elected leaders. However, stewardship also includes accountability, so administrators understand their actions are subject to review and reversal by those with constitutionally legitimate authority (Kass 1990, p. 127).

Writing from an institutional perspective, the several authors of the "Blacksburg Manifesto" argued for a legitimate, virtually coequal place for public administration in the constitutional order of the USA (Wamsley et al. 1987). This model of administrative discretion is located further toward the trustee end of the administrative role continuum than the stewardship concept. The authors base their argument on the importance of public administration in the contemporary American governance setting. Though the nation's founders did not establish public administration as a separate branch of government, it has become a large and influential part of process of making and implementing public policy. In today's constitutional order, public administration is not merely an apolitical tool of policy implementation, it serves the public interest in a political context. Because it is as representative of the broader public as the three established branches of government, the authors claim, public administration may turn to any of the three branches of US government, the public, or the administrators' own conception of the public interest for guidance (Wamsley et al. 1987, pp. 312–314).

Well toward the trustee end of the role continuum, a "discretionist" model is found that very nearly frees administrators from the will of elected leaders. The argument is that the overhead democracy model of elected representation is failing as a measure of the public will, characterized as it is by flawed election processes and the poorly developed capacity of many elected leaders to govern in the public interest. In contrast, public professionals, trained in administration and sensitive to the public interest, are often better equipped to deal with the challenges of policymaking and implementation. A version of this model uses the metaphor of Plato's guardian class to suggest that public administrators should have close to complete discretion to act in accord with their professional training. The authors who use this metaphor recognize, though, that they may not be ready to abandon entirely the notion of democratic oversight of administration (Fox and Cochran 1990, p. 109). In another version of the model, administrators function as facilitators of citizen discourse on public issues, working toward answers to the question of what should be done next (Fox and Miller 1995).

Also near the trustee pole of the continuum is a model of public administrators as "citizens in lieu" of the rest of the citizenry, acting on their behalf (Cooper 1991). Most members of the public do not have the time or specialized knowledge to be directly involved in policymaking and administration, so in this model the career professional represents their interests within the public agency. The general public will is expressed through broad policies adopted by elected leaders, and then public professionals provide the details needed for implementation. They interact with citizens as policies are implemented, bringing back to elected leaders what they have learned so that changes in policy can be made as needed. In this model, accountability to elected leaders is regarded as conditional; in this sense, the model portrays a horizontal rather than hierarchical set of relationships, in which participants in governance work together rather than exercising dominance (Cooper 1991, pp. 139–142).

Discussing models of administrative discretion leaves open the question of what values administrators have in mind as they make decisions. "Regime values" (Rohr 1989) are often mentioned as a source of guidance to administrators, who would consider the constitutional history and institutional context as illustrated by specifics such as judicial decisions. This concept is somewhat limited by its American setting (Overeem 2015), but there is also research on cross-national comparison of administrative values, finding similarities and differences among public administrators in countries with quite different cultural contexts. An example is a study of rank ordering of more than 20 ideal and actual values in practice by administrators in the Netherlands and in China, values such as accountability, effectiveness, efficiency, expertise, transparency, and social justice. The high ranking given ideal values such as expertise by respondents in both countries reflects similarity in values, but rank ordering of the most important actual values in practice, such as obedience in China and effectiveness in the Netherlands, reflects the expected variation in

cultural emphasis (Yang and Van der Wal 2014). Interestingly, the substantive value of equality was ranked low in importance in both countries, while the substantive value of social justice was given a low ranking by Dutch administrators and did not appear on the Chinese ranking.

## Conclusion: Administrative Politics in a Multidimensional Context

This chapter began with the claim that politics can be found throughout public-sector administrative agencies. Administrative politics has been examined from the perspectives of control of bureaucracy and administrative discretion, finding a context that includes differing political cultures and legal structures, multiple levels of government, and public organizations engaged with many other participants in a cross-sectoral, networked process of governance. Though much of the theory building in administrative politics focuses on national-level public agencies, subnational levels are also important in examining politics-administration relationships, for example, between city managers and elected officials.

Few elements of the contemporary political and economic environment of public administration are new. The term "new" is sometimes used loosely in public administration, perhaps as a means of calling attention to an idea that might otherwise be ignored. Features of the administrative environment such as intergovernmental relations, contracting out, citizen involvement, and public-private relationships have all been part of public affairs and public administration for decades. Today, however, the societal context of public administration is particularly complex, not least because of the ongoing blurring of boundaries between the economic imperative of the market sector and the public purposes of the government sector.

In this contextual setting, clear functional demarcation between politics and administration is often elusive. Nevertheless, characteristics of the roles of people involved in public affairs need to be recognized, because societal expectations are different in important ways for career professionals, elected leaders, political appointees, and the public. These roles are dynamic, not static, involving cooperation, conflict, and feedback prompting change. Administrative politics can be described as an ongoing process of defining the roles of public professionals who are accountable to legitimate state authority through the people's representatives. It is in this process, which is political in the broadest sense, that the latitude of administrative discretion available to an individual public administrator becomes apparent.

There are limitations on the generalizability of the ideas reviewed in this essay, in no small part because of the cross-national variation to be found in history, culture, politics, and economics. Nevertheless, concepts such as control of bureaucracy, administrative discretion, administrative roles, and application of economic thought in the public sector can be used to inform research and practice in administrative politics.

# Administrative Procedure

Dacian C. Dragos
Center for Good Governance Studies, Babes Bolyai University, Cluj Napoca, Romania

## Synonyms

Administrative process

## Definition

Administrative procedure relates to the methods and processes before administrative agencies, as distinguished from judicial procedure, which applies to courts. The administrative procedure can be defined as a succession of acts and operations issued or performed by an administrative body on its own motion or upon request, in order to adjudicate on rights, interests, and obligations of parties of the procedure or decide based on the public interest, according to the laws and other regulations in force. There is no widely recognized definition of the administrative procedure – many General Administrative Procedure Acts (GAPAs) only refer to the term and do not define "administrative procedure" as such (except the German GAPA and the Portuguese GAPA).

## Introduction

In all countries that are attentive to the idea that the public administration is bound by the rule of

law and needs legitimation by the people, there is an ongoing debate about the importance of administrative procedure (Pierce et al. 2009; Pünder 2013a; Barnes 2010).

The advantages of administrative procedure are well known: protection of rights of parties, information gathering, sound decision-making and thus an increase in the legitimacy of the final decision, and pre-litigation remedies. At disadvantages, we can list the need for resources in terms of time, personnel, and financing for an effective decision-making procedure.

GAPAs were adopted all over the world: most European countries have such a procedural law, and then outside Europe, the GAPAs are to be found in the USA, Japan, South Korea, China, Taiwan, Chile, and Peru, just to name a few. In the formation of GAPAs in the world, we can identify three historical stages: the founding models were established in Spain (1889) and Austria (1925) and the latter then inspiring other European countries. Postwar laws that also influenced other systems were adopted in the USA (1946) and Germany (1976). From the 1990s on, the GAPAs have flourished, sometimes as a response to the need to reform former communist regimes in Eastern Europe.

## Administrative Procedure Versus Court Procedure. Hybrid Procedures: Tribunals

First, we have to distinguish between administrative procedure and the procedure by which courts adjudicate on administrative acts (Auby 2014a). In the first one, administrative bodies are in charge with issuing administrative acts and then reviewing them through administrative appeal, on reasons of legality and/or opportunity (exercise of discretion). In the latter, the courts review administrative acts on legality reasons and only exceptionally on the use of discretion. Generally, the scope of the administrative procedure is wider than that of a court procedure.

In most of the administrative systems, this distinction is strict and easy to understand, but recently there is a development called "tribunalization" which means that administrative procedures become more jurisdictionalized and tribunals that are in charge of such procedures are gaining more and more influence. In countries who experiment with tribunals and also have a GAPA (such as the USA), the GAPA also applies to quasi-judicial bodies (for instance, to administrative law judges in the USA).

A tribunal is an administrative body with quasi-judicial nature, a hybrid that aims at dealing with administrative disputes outside courts of law but still assuring a proper and balanced protection of the rights of parties. Its main function is to adjudicate disputes between citizens and governmental agencies. Although tribunals adjudicate many more administrative disputes than courts, their role as "dispensers of administrative justice" (Cane 2009) receives relatively little scholarly attention. An effective administrative tribunal addresses in the same time the shortcomings of an administrative appeal procedure (lack of independence) and those of court proceedings (length, associated costs, in some cases lack of specialization), providing for independent review and quick redress in (sometimes) less complex matters, which do not need the intervention of a court.

## Administrative Procedure: Phases

The stages of administrative procedure follow the usual trajectory of a request from its formulation to its resolution and beyond. Depending on the way in which the administrative procedure laws are drafted, the content of the procedure may vary, but generally the following stages are considered to be part of all administrative procedures:

(a) *Initiation/commencement*. Generally, the administrative procedure is initiated by *petition/request* addressed by an individual or a legal person to an administrative body or ex officio by an administrative body. Sometimes, the obligation to initiate an administrative procedure flows from the law or other legal norms that are binding on the administrative body.
(b) *Parties of procedure*. Rules on how to interpret the notion of "party in the procedure,"

"administrative body" or "public authority," "legal person," or "individual" are to be observed, if they are enshrined in the GAPA, because the different features of the administrative systems may entail different interpretations. Also, rules about representation of parties during procedure are important, as well as the communication with such parties.

(c) *Incidents of competence/jurisdiction*. The administrative body has to verify its competence to deal with the administrative matter at hand or else to transfer the matter to the competent body. Rules on conflicts of competence and delegation of competence are also laid down in the dedicated sections of the GAPAs.

(d) *Investigations/evidence*. The administrative body carries out investigations in order to establish the facts of the case, if the case is either ex officio or at the request of the parties. The evidence may be comprised of statements from parties or other persons, documents, and site visits. If the administrative body needs an expert opinion on the object of the investigation, such opinions are included in the procedure files. The burden of proof lies with the party that has initiated the procedure, but the administrative bodies have the obligation to make available to party's information under their possession.

(e) *Consultations* with interested parties or parties that might be affected by the final decision are necessary in order to establish all the facts and legal implications of the case.

(f) *Right to be heard*. Potentially aggrieving decisions are to be adopted only after the parties that might be affected by the decision are heard and their statements recorded in the file. All interested parties must be given access to their files and the possibility to comment on the way the procedure is conducted and on the findings.

(g) *Principles* guiding the discretion exercised by public bodies during administrative procedure and the conduct of procedure itself include legality, transparency, access to information, fairness, impartiality, equal treatment and nondiscrimination, objectivity, confidentiality and protection of personal data, proportionality, informality, control and liability, conflict of interest, and reconciliation of parties.

(h) *Time limits* for the conduct of procedure have to be observed by all parties in procedure. Extension, reinstatement of time limits, and calculation of time limits are incidents in the procedure. Usually, the administrative silence (failure to observe the time limits for answering a request by a public body) means rejection of the request, but sometimes the presumption is reversed, and for expressly identified acts, administrative silence might mean acceptance.

(i) *Administrative acts*. Defining and interpreting the notion of administrative act is important in order to establish the scope of judicial review. *Interim decisions* are necessary if the danger of irreparable damages occurs, and they can be challenged separately on administrative level or in court. *Final administrative acts* are the ones that have legal effects and can be challenged through the administrative appeal or judicial review. The form and content of administrative acts are determined in GAPAs or in other laws or in the case law of the courts when no codification of administrative procedure exists. Acts need to be reasoned in order to justify the solutions envisaged in them and to inform the addressees. Administrative acts might have effect only for the future or even for the past (retroactive effects), under the conditions established by law. They enter into force by publication (rulemaking, general acts) or communication to the beneficiaries/addressees (adjudicating/individual acts).

(j) *Administrative operations*. Sometimes the administrative procedure does not end with the issuance of an administrative act, but with other forms of administrative activity, called generically administrative operations. They are actions that do not have legal effects by themselves, but either serve the issuance of an

administrative act or serve as modes of execution of such acts.

(k) *Administrative contracts*. The outcome of an administrative procedure may be also an administrative contract, concluded between a public body and a private person or another public body, for the execution of works and provision of services or goods, financed entirely or partially by public funds, under a public law legal regime – for instance, public procurement and concessions.

(l) *Administrative appeal* is an administrative remedy for unlawfulness or inopportunity of an administrative act or for the refusal (explicit or tacit – administrative silence) to solve a request. Administrative appeals may be mandatory before going to court for judicial review, or optional, with certain benefits for the appellants such as the extension of deadlines for court action. The competence for solving the administrative appeal lies with the issuing body, the superior administrative body, or the control body. The appeal to a tribunal is a hybrid, quasi-judicial procedure, but still different from the court procedure per se. Some GAPAs provide also for alternative means of dispute resolution – arbitration, mediation, conciliation, or just refer to the possibility to resort to such ADR tools.

(m) *Execution of administrative acts*. After entering into force, acts are executed either voluntary or forcefully, and the rules for forceful execution are provided by the GAPAs or by other laws.

(n) *Suspension of administrative acts* refers to the stay of execution for acts that may produce damages that could be irreparable. Suspension can be decided either by the issuing authority or by the review bodies. In some jurisdictions, the administrative appeal suspends de jure the execution of the act, and the issuing authority may reverse this effect by invoking the public interest in execution. In other systems, the suspension may be granted only upon request and proper reasoning.

(o) *Reopening of the procedure*. Some GAPAs provide for instances where administrative procedures may be reopened – new circumstances entail a different outcome surfaced, court decisions that contradict the solution adopted by the public body are issued, a previously lawful act with continuous execution becomes unlawful, etc.

These are roughly the main phases of an administrative procedure. In identifying the most relevant of them, we looked at the most referred to GAPAs (the USA, Germany, Austria, the Netherlands) and at the more recent ones, developed by SIGMA OECD for countries in Central and Eastern Europe – Croatia (2009) and Albania (2014) – as well as at the Research Network on European Administrative Law (ReNEUAL) Model rules of Administrative Procedure (2014) that will constitute the basis for a codification of the administrative procedure in the EU.

Apart from the stages discussed above, GAPAs usually include also provisions regarding information management and institutional issues (conflict of interests, decision-making by collective bodies).

## The Importance of Codifying the Administrative Procedure

Codification can be defined broadly and non-technical as "the process of repealing a set of acts in one area and replacing them with a single act containing no substantive change to those acts" (Mandelkern Report). However, some codifying processes are also creative and reformatory, in the sense that they change some rules that may be redrafted in a clearer or simpler manner or insert new provisions.

The advantages of codifying administrative procedure rules (Ziller 2011; Mir-Puigpelat 2011) are generally applicable:

(a) *Increased legal clarity and certainty.* Based on the experience of jurisdictions that have codified their procedural administrative law, it is clear that a written code, which summarizes, coordinates, and systematizes the procedural provisions that are spread across

secondary legislation, courts judgments, and codes of conduct adopted by institutions, bodies, offices, and agencies, is a significant improvement in terms of legal clarity and certainty and would help to achieve the principles of simplification and accessibility associated with the imperative of quality regulation. Of course codification means that the rules of procedure will be more abstract than they would be in a specific sectoral regulation, but this would also allow its provisions to be applied to all areas in which the administration acts, without the need to adopt any more rules for specific fields. Other advantages include a better knowledge of current law among authorities and citizens which also favors its acceptance and observance by both: the reduction of costs to business for obtaining information on the applicable law and increase of the competitiveness of the respective territory. Greater clarity in legislation also results in less litigation and lower costs for administering the judicial system.

(b) *Standardization of procedural rules and guarantees and coherence of principles* – to the benefit of citizens, who would enjoy certain uniform procedural guarantees in their relations with the whole administration, boosting the efficiency of the administrative action. As is commonly known, a well-designed administrative procedure not only serves to guarantee the rights and interests of citizens but also, and very importantly, helps to increase the quality of administrative decisions and their acceptance by their intended targets, the uniform application of the law.

(c) *Default procedures to fill gaps in existing laws*. Gaps exist due to sectoral legislation and procedures and also due to the development of the administrative law through case law which addresses specific issues and not the procedure in a uniform manner.

(d) *Opportunity to reform*. Codification that is not limited to summarizing, coordinating, systematizing, and resolving the contradictions in the existing rules and principles, but uses this opportunity to improve the rules, by providing innovative solutions to current challenges and problems, is a drive for reform in public administration.

(e) *Stability of legal rules*. A code is intended to resist a long time, thus giving stability to the legal rules it encompasses. The codification should incorporate the technical elements ensuring that it is resistant to the passage of time and that it can be duly adapted in line with the rapid changes that are currently occurring, in order to thus reduce the risk of petrification and obsolescence. The sectoral legislation cannot be stopped altogether, but it will at least have to take into consideration the general legal framework.

## Codification of Administrative Procedure in the USA

The codification of administrative procedure in the USA was finalized in 1946 with the adoption of the Administrative Procedure Act (APA), a federal statute that governs the way in which administrative agencies of the federal government of the USA may propose and establish regulations. The APA also sets up a process for the US federal courts to directly review agency decisions. It is one of the most important pieces of the US administrative law, as it applies to both the federal executive departments and the independent agencies. The text of the APA is included in the US Code at Title 5. Based on APA, a similar Model State Administrative Procedure Act (Model State APA) was drafted, but not all states have adopted the model law.

According to the Attorney General's Manual on the Administrative Procedure Act, drafted after the 1946 enactment of the APA (Attorney General 1947), the basic purposes of the APA are to require agencies to keep the public informed of their organization, procedures, and rules, to provide for public participation in the rulemaking process, to establish uniform standards for the conduct of formal rulemaking and adjudication, and to define the scope of judicial review. The APA's provisions apply to many federal governmental institutions. An "agency" is defined as "each authority of the Government of the United

States, whether or not it is within or subject to review by another agency," with the exception of several enumerated authorities, including the Congress, federal courts, and governments of territories or possessions of the USA [5 U.S.C. 551(1)]. Courts have also held that the US President is not an agency under the APA [Franklin v. Mass., 505 U.S. 788 (1992)].

## Codification of Administrative Procedure in the EU

Many European jurisdictions have administrative procedure acts that regulate the conduct of administrative procedures: Austria, Bulgaria, Croatia, Spain, Germany, Hungary, Luxembourg, Denmark, Sweden, Poland, Italy, Portugal, the Netherlands, Greece, Czech Republic, Lithuania, Slovakia, Estonia, Slovenia, Finland, Norway, Latvia, Switzerland, and recently Albania. They usually follow the content discussed above, with few differences.

In a European comparative perspective, English and French law are well worth mentioning as both countries lack an exhaustive codification of administrative procedural law – in spite of the tendencies toward codification in other European countries, which to a good part follow the German (or the comparable Austrian) role model. However, the English and French administrative procedural standard is comparable to German and American law (Pünder 2013b). The explanation lies in the fact that in the UK and France, the administrative law is a judge-made law, and judges want to keep the control over vital aspects of administrative law (Auby 2014b).

Codification of EU administrative procedure is a new topic in recent years, as European public law scholars have been debating whether the basic rules and principles of administrative procedure applicable to both the EU administration and the administrations of the member states when implementing EU law should be codified at EU level (Mir-Puigpelat 2011). Such codification would have an evident influence within the various member states through cross-fertilization of standard institutions and procedures, helping in the construction of a European identity and the resulting increase in Union integration. The extension of the codification to national administrations is also an envisaged path in the future (Harlow 1995; Schwarze 1988; Chiti 2004; Mir-Puigpelat 2011), although other scholars consider that there is no legal basis for the EU to attempt this (Vedder 1995; Kahl 1996).

As a result of these debates, the Research Network on European Administrative Law (ReNEUAL) has drafted the Model Rules of Administrative Procedure, which have been presented to the European Parliament who then adopted a resolution (15 January 2013) with recommendations to the Commission on a Law of Administrative Procedure of the European Union.

The ReNEUAL Model Rules of Administrative Procedure are organized in six "books." These books are designed to reinforce general principles of EU law and identify – on the basis of comparative research – best practices in different specific policies of the EU. Book I addresses the general scope of application of the model rules, their relation to sector-specific rules and member state's law, and the definitions of wordings applied in all the books. The Preamble of Book I contains a summary of principles, which guide administrative behavior and the interpretation of all subsequent norms in Books II to VI. The latter books cover more in-depth administrative procedures in the EU that have the potential to directly affect the interests and rights of individuals. The books address nonlegislative implementation of EU law and policies by means of rulemaking (Book II), single-case decision-making (Book III), contracts (Book IV), and, very important for the composite nature of EU administration, procedures of mutual assistance (Book V) and information management (Book VI) (Hofmann et al. 2014).

## Conclusion

Administrative procedure is at the core of administrative law, thus the interest in its codification and stability in time. National systems of administrative procedure, traditionally different and

largely considered to be incompatible with the process of convergence, are more and more convergent under the pressure of international and regional (European) commonly shared values and principles or under the influence of court decisions (ECHR and CJUE for the EU members states). Thus, the ideal of having convergent administrative procedures globally is not an illusion any more. Different national GAPAs are comparable, and they feature the same principles and institutions of administrative law. The codification touches upon fields that were intangible a few years ago, such as the common European administrative law. Living without GAPAS is also possible, as long as administrative procedures are regulated in different laws and feature the same principles and institutions that are commonly shared by the legal doctrine and offer proper standards of protection for citizen's rights and interests.

# Administrative Reform

Jerry E. Herbel
Kennesaw State University, Kennesaw, GA, USA

## Synonyms

Change management; Organizational restructuring; Process improvement; Reorganization; Technology adoption; Transformational leadership

## Definition

Administrative Reform: Changes to the structure or processes of public organizations designed to improve outcomes or respond to public demands for better accountability or transparency.

## Introduction

One could say that every administrative system and every administrative agency is continuously engaged in some phase of administrative reform. Administrative reform is not only continuous but is often the first step managers can take either to improve performance or recover from significant blows to agency prestige. Reform is a common element of high-performing organizations and effective leaders. One key to grasping the role of reform in public organizations is to understand how the best public managers lead organizations to expect continuous reform and objectively evaluate the results of reform. These concepts lie at the heart of twenty-first-century public management.

Administrative reform is best understood as changes to the structure or processes of public organizations designed to improve outcomes and respond to public demands for better accountability and transparency. This definition includes both the internal and external factors that drive reform and the goals that well-designed administrative reform can achieve. Performance of public organizations depends on matching processes to expected outcomes, thereby making reform of those processes integral to improving outcomes as conditions or missions change (Pollitt and Bouckaert 2004). As organizations mature and adapt to new public or stakeholder expectations, reforming processes and structures becomes a critical component of the organizational environment.

However, not every change amounts to reform. For example, adjusting the hours of work for employees could be considered a "process change," but is too minor to fit comfortably under the general heading of reform. Some degree of magnitude of organizational change is also implied in order to be considered reform in the fullest sense. True reform determines both the agency's performance and the outcomes it is capable of achieving and in this way redirects organizational activities. At the same time, certain administrative actions that may seem trivial on the surface can amount to fundamental reform. An example of this would be changes to employee benefits such as the elimination of tenure in a public university. Such process reforms so alter the way a public organization functions that it has a measurable impact on outcomes. These types of changes comprise the field of administrative reform both in practice and as a subject of academic study.

Frequent and significant administrative reform is a world-wide phenomenon. Since the 1980s, for example, public institutions throughout Europe but especially in Eastern Europe implemented enormous changes to adapt to European Union standards for transparency and transnational standardization. In other cases, reform results from a desire to adapt internal processes to globalization. States such as Vietnam, China, and Indonesia adapted their public bureaucracies to meet the needs of their expanding economic power and political influence. Attempts at administrative reform in Africa have been extremely uneven, with notable success in places such as Nigeria and Uganda. Where failures have occurred, it has been largely the result of inadequate integration of cultural practices with the requirements of bureaucratic accountability, impatience to allow reforms time to mature, and a penchant for sweeping reforms when incremental change might be better. The pressing need for capital and technology in Africa makes these miscalculations understandable. But, the lesson for administrators everywhere is the extent to which administrative reform affects bureaucracies, regardless of size or mission. Effective management of public organizations depends on fostering a culture of reform to ensure consistent delivery of crucial public services.

## Brief History of Administrative Reform

The expectation of continuous administrative reform is a relatively new development in public

administration. Around 1500, at the beginning of the modern bureaucratic era, the work of court ministers was expected to be consistent and stable amid changing policy environments and political elites. The strength of medieval governments and even of the feudal system itself was a by-product of the need to establish stable administrative practices that could provide policy continuity. Feudal offices, even relatively low-level local administrative or law enforcement positions, were heritable. This allowed continuity in administrative practice as well as smooth intergenerational transfers of authority. In addition, some countries tried to involve as high a percentage of the population as possible in the duties of government administration. For example, it has been estimated that half of all males in England served in official county or municipal positions during any 10-year period. This provided another source of administrative and policy stability.

The preference for stability that was integrated into the very nature of modern public bureaucracies as they were being established persisted. In the nineteenth century, Max Weber assumed that ideal bureaucracies would be resistant to reform and he assumed that this was one of bureaucracy's most desirable features. Continuity and steadiness of purpose made public sector organizations and their policies permanent and predictable elements of modern life. This gave bureaucracies justification for their hierarchical structures, division of duties, and systematized work processes.

But, the assumption of stability could only last as an expression of an ideal type. In reality, public bureaucracies have long been the subjects of serious reform. For example, administrative reform has been part of the American bureaucratic experience since its inception. Leonard D. White's (1958) four-volume history of US administrative development demonstrated that administrative processes and structures evolve in long arcs that are very often out of administrators' control. External factors have led throughout American history to continuous shifts in administrative practice and broad reforms. External factors have included economic, political, and social changes which served as catalysts for such administrative reforms as the professionalization of the civil service and improvements in public ethics. But, despite the various external factors leading to reform, White observed that the single most important element in administrative reform is the personalities of senior administrative leaders. When leaders recognize or even anticipate change, the response from the bureaucracy is quicker and more effective. On the other hand, leaders who are slow to realize changing circumstances or even actively fight against them impede the proper development of agencies to better serve their publics.

The municipal reform era of the 1920s through 1960s illuminates the strong connection between reform and leadership. As cities grew and social problems multiplied in the first half of the twentieth century, the structure of municipal management changed dramatically as more and more cities took on the adapted city model that was neither a purely political mayor-council form nor a purely administrative council-manager form. The adoption of one or another variation was driven by the needs of communities and the characteristics of those filling leadership positions. The single most important criterion for these reforms was, as might be guessed, performance of the municipal government in addressing issues important to the citizens (Frederickson et al. 2004). Once again, the adoption of structural and procedural reform helped improve government performance in achieving outcomes.

Significant structural changes to basic government processes such as the Pendleton Civil Service Reform Act of 1883, the publication of the Brownlow Committee report in 1937, and the Civil Service Reform Act of 1978 are infrequent but powerful moments in administrative reform. These three examples introduced sweeping changes into public management at all levels and all were reactions to changes in the demands placed on government to perform better and to exemplify democratic principles. While these reforms may have only a minimal impact on individual government employees, the administrative reform movement that began in earnest in the twentieth century has had far-reaching importance.

## Administrative Reform and Organizational Performance

Popular literature is replete with references to the importance of organizational reform and performance during periods of rapidly changing organizational dynamics and of management's role in facilitating and guiding performance of subordinates. Fueled by a growing realization that organizational reform was becoming a permanent feature of modern life, Spencer Johnson's *Who Moved My Cheese?* sold more than 26 million copies worldwide since its publication in 1998 and has been translated into 37 languages. This introduction to the benefits and pitfalls of organizational reform sparked interest in both the private and public sectors. Workers today are perhaps more accepting of reform than ever before. And, they are more attuned than ever to the crucial role leaders play in making reform effective.

The emergence of a broader culture of reform in the twentieth century came as a response to demands for higher levels of public sector performance. The increasing public demands for high levels of efficiency and effectiveness created pressures that have culminated in the expectation of continuous reform. Responses to public demands for solutions after highly publicized failures of public bureaucracies now often include procedural reform as a way to guarantee improved outcomes. Recently, for example, police departments across the country have adopted new methods of policing in the wake of high-profile cases involving excessive use of force. In cases where agency performance is significantly below expectations, administrative reform is either the only corrective attempted or is central to a multipronged effort to improve outcomes. Therefore, the continuously reforming agency, searching for ever higher levels of performance, serves as the equilibrium expectation for public managers in responding to critics or changing circumstances. Normatively, reform advocacy and effective implementation of reform is the sine qua non of ethical organizations and strong leaders. Administrative reform undertaken to public answer demands for performance and transparency demonstrates a commitment to public service values. These demands also proliferate in the wake of an agency scandal or as whistleblowers point out serious cases of agency malfeasance.

One of the most widely accepted theories of public administration is the notion that workers' performance is related to the structure and processes of the organizations in which they work. Administrative reform changes formal structures and processes that trigger this reaction, hopefully in a desirable direction. One example of this is the creation of the Department of Homeland Security in the wake of numerous bureaucratic failures leading to the 9/11 attacks. Since most scholars and practitioners agree that workers respond to the influence of structural and environmental factors, changing those factors generates changes in workers' expectations that can be extraordinarily positive, or can create severe dysfunction if not managed well.

Chester Barnard (1938) theorized a "zone of indifference" toward bureaucratic change. Barnard saw this zone as defining the limits of worker's tolerance for administrative reform. The boundaries of this zone constitute the limits of tolerance that workers have toward organizational change. Relatively minor changes to structures or processes inside this zone are unlikely to have much of an effect on morale or productivity, while changes from outside the zone can inspire extreme reactions as workers come to understand the effects the changes will have on them personally. These reactions sometimes jeopardize the positive effects managers expect reform to produce. Herbert Simon's (1947) *Administrative Behavior* expanded on Bernard's work. Simon called the range of worker comfort with change the "zone of acceptance" and noted that organizational identification is the key to understanding tolerance for organizational change.

To a certain extent, performance affects reform just as reform affects performance. When agencies perform poorly, administrators face pressure to improve outcomes and are also expected to engage, simultaneously, in the difficult process of agency reorganization. This dual imperative can be compounded if the agency faces funding cuts due to performance budgeting, where resources are redirected from under-performing

agencies to high-performing ones. On the other hand, because high-performing agencies do not usually face calls for reform, they can become complacent and allow operations to stagnate. Without the spur of demands for reform from stakeholders, more management effort is required to evaluate the need for reform and convince workers of its necessity.

Designing neutral or nonpolitical tools to determine how well agencies perform their missions is critical for developing and implementing effective reforms. The George W. Bush administration implemented a measure called the Program Assessment Rating Tool (PART) to assess performance throughout the federal bureaucracy. The intended effect of PART was to gather data from managers on a standardized survey allowing evaluation of program purposes and design, planning, management, and results. While PART did produce some striking insights into a variety of agency practices, it ultimately did not become a neutral, bipartisan assessment tool. As a result, whatever insights PART may have provided have been dismissed by advocates of both parties as biased and that the results are tainted by politics (Lavertu et al. 2013).

## Theories of Reform Leadership

Leadership is essential in establishing the boundaries for workers' zone of acceptance for reform and for the overall effectiveness of administrative reform. As a general rule, public administration research over many years and in countless environments has established that administrative reform is most productive in organizations led by managers who view reform positively. When managers are optimistic about how beneficial administrative reform could be and convey these feelings to workers, workers view management reform directives with credibility, and their zone of indifference toward reform enlarges (Dull 2009).

Theories of reform leadership, and administrative leadership generally, fall into three categories. The first are trait theories which emphasize personal traits of the manager. These theories, originated by Max Weber with his notion of charismatic leadership, see leaders as born, not made. The second are behavioral theories, which see leaders as made, not born, mainly because of the rather unnatural circumstances in which administrative leadership exists. Artificial organizing of human labor in the structures of state executive power requires a learned adaptation to manage effectively. Ralph Hummel (2008) pointed out the challenges this artificial environment poses for leaders and the potentially harmful effects of bureaucratic life on workers. A third class of theories, contingency theories, see leadership as determined by the organizational environment. According to this view, leadership of administrative reform should be measured against the inherent difficulties introduced by reform efforts and the upheaval in relationships it leads to. For example, managers may face different challenges in reforming a drivers license office compared to an organization conducting primary scientific research.

When managers recognize the need for reform, they tend to become agents of change themselves, seeking to inculcate a reform mentality throughout the organization. The reform initiatives of those change agents multiplies by leading to further changes as the effects of previous reform become observable. This approach is known as diffusion of innovation. Especially with regard to integrating technology in the workplace, the speed and reach of diffusion depends on the enthusiasm managers exhibit for the use of technology. Leaders are the central hub around which administrative reform revolves. Without strong commitment from managers to embrace changes, especially changes in essential technologies, little progress is likely to occur.

Many reforms are the results of technological changes or other innovations introduced from outside the organization. The diffusion of innovation follows the S-curve of diffusion theory described by Everett Rogers (2003). Significant organizational reform that includes diffusion of new technology proceeds in two stages: (1) the initiation stage that involves agenda setting and matching a technological solution to a problem the organization needs to solve, and (2) the

implementation stage where the technology is adapted to particular agency circumstances, its role in agency problem-solving is clarified, and the innovation is routinized to become synchronous with the ongoing activities. Successful diffusion of innovation therefore depends on leadership commitment to bring improvements to bear in solving problems. By demonstrating an eagerness to exploit technology for agency purposes, leaders facilitate the speed with which reform occurs and ultimately overall agency performance.

This is a common occurrence, as organizational change is often the result of external factors such as changing technology and social values. Leadership plays a key role in identifying these changes, scanning the organizational horizon for benchmarks to use in designing reform, and then advocating reform through to implementation to adapt the institution to the new values. The characteristics of society and the events that shape social perceptions play a major role in determining the macro direction of administrative practice. In periods marked by high distrust of government, as in the Watergate era of the 1970s, public demands for transparency may outpace calls for high levels of performance. Conversely, repeated policy failures generate greater demand for reform aiming at improving outcomes and transparency may be of less perceived importance.

The transformation of government ushered in by the New Public Management (NPM) movement that emerged in the 1990s was a response to widespread dissatisfaction with bureaucratic performance throughout all levels of government (Osborne and Gaebler 1992). New Public Management was a reform designed for outcomes-oriented government led by managers empowered to take action quickly with maximum discretion. Obviously, this created a parallel demand on managers to adopt a more entrepreneurial approach to decision-making. NPM leadership requires managers eager to adopt a more aggressive posture in tackling problems to move organizations away from old ideas and old ways of doing things.

This second aspect of reform leadership, moving away from old ways of doing things, is often overlooked but presents perhaps a more difficult task than innovation and reform. Before a new practice or process can be adopted, an old one must be jettisoned. Many employees feel uncomfortable with the rapid elimination of traditional patterns of activity they trained to do and became comfortable with. But businesslike governance requires constantly challenging work processes and the risk-taking implicit in rejecting a method that, while inefficient, was nevertheless safe. Managers in the New Public Management era encouraged their employees not just to embrace risk, but to manage risk so as to increase the likelihood of successful outcomes.

What are the characteristics of the more effective leaders in implementing these difficult reforms? Among the most important is a broad point of view, born from a rigorous and varied education that exposes managers to important ideas in the widest possible range of subjects. Some exposure to psychology, economics, history, sociology, political science, and the humanities would provide essential knowledge building blocks. The second characteristic is the ability to maintain a certain degree of detachment or moral autonomy that allows leaders to question their own performance and to challenge the broader direction of agency mission development. Terry Cooper's (2012) idea of ethical autonomy helps leaders stay in tune with public demands for transparency. A third factor, growing out of the other two, is a free mode of inquiry, not unlike a scientific attitude, to examine agency operations objectively, with an open intellectuality that raises hard questions and seeks data-driven assessments of performance. These characteristics will aid in facilitating reform whether it comes in the form of integrating technology, understanding public demands on the agency, shifting political and ideological priorities, or broad developments in economic conditions.

## Conclusion

Administrative reform is a core concept in public administration for administrators and scholars alike. Over time, reform movements have generated tremendous benefits for those who work in government and for citizens who depend on the

work they do. The recent appreciation of leadership as the keystone to reform and consequently to improvements in government performance has grown substantially in recent years. More work is needed to determine with greater precision the organizational and human factors that lead to the best climate for initiating and sustaining a reform mentality. Additionally, the integration of administrative reform as a topic in professional graduate programs, or even as stand-alone courses, would seem to be relevant in preparing future public leaders to continue adapting and improving their agencies.

# Administrative Reform in Ireland: Exploring Continuity and Change in the Irish Civil Service

Petros B. Ogbazghi
Department of Public Administration, University of Asmara, Asmara, Eritrea

## Synonyms

Administrative reform; Civil service; Ireland

## Definition

Civil Service refers to a body of permanent and professional employees of the executive branch of government, who constitute the state bureaucracy, which is entrusted with the provision, implementation, and execution of government functions that are delivered to citizens.

Administrative reform can generally be defined as the introduction of a comprehensive or incremental set of structural, institutional, attitudinal, and organizational strategic changes that are aimed at transforming, modernizing, and adapting the administrative system to meet national development goals.

## Introduction

Shaped by the common features of British government's administrative structures and institutions, commonly referred to as the Westminster-

Whitehall model, the Irish civil service system is engendered or at least influenced by long-established British precedents. Once British administration over Ireland was terminated, and the transfer of sovereign power to Irish hands effected, the first task of the Provisional Government of the Irish Free State, in 1922, was to take ownership of the wheels of political power from Dublin Castle – the seat of British administration in Ireland – to the *Dàil Èireann* (the Irish Parliament). Although the bulk of the reform initiatives during the immediate post-independence was motivated by the imperatives of regime consolidation, the common understanding that the machinery of government, and the civil service, in particular, had become fragmented, inefficient, and less effective, and hence in need of reform, had long played on the back of the minds of the new leaders. But as it turned out, the reforms of the 1920s were more of adapting the inherited administrative machinery rather than radically transforming it, which was deemed to have worked relatively well in its current form with only a few amendments and modifications needed to reflect the new political reality of independence.

Reform initiatives were undertaken during the 1950s, and there was a new reform package in the 1960s, following what came to be known as the Devlin Report. Reforms during these periods too proved to be merely ad hoc, residual, and ameliorative rather than holistic initiatives. However, during the 1980s, it was becoming apparent that major reform initiatives were needed on a number of fronts, including enhancing the policy making role of public administration, its effectiveness was stymied by senior civil servants' commitment to ministerial functions, as well as the need to provide government departments with specialist staff all the while increasing staff morale impacted by lack of motivation and career path prospects. To this end, in 1984, a *White Paper, Serving the Country Better* came along, with its emphasis on the significance of management principles against the backdrop of maximizing effectiveness by rendering public administration more economical and cost-effective. Despite popular, in practice, however, this set of reforms was never or as thoroughly implemented. It was not until the early 1990s that the impetus for a comprehensive reform finally came from two corollary and parallel sources: Ireland's membership into the European Economic Community and the introduction of the Social Partnership Agreement framework to policy making, which set the stage for the espousal in 1994 of a major reform package known as the Strategic Management Initiative.

## Civil Service Reforms of the 1920s

The first reform ever to be enacted following the independence of Ireland in 1922 related to the passing of the Civil Service (Regulation) Act, 1924, which saw the establishment of the Civil Service Commission. The hitherto British administrative institutions and the personnel that filled them came to be subsumed under a centralized control exercised by the newly established Ministry of Finance. Although there was a preponderance of the inherited structures and practices, there were also marked differences that defined the organization and operation of the emergent Irish civil service. These changes were made to adapt the inherited practices in keeping with the prevailing political and economic realities of the nascent state. Specifically, the imperatives of nation-building and regime stability against the backdrop of the just-concluded civil war and the subsequent demobilization of members of the army required that a large number of these unemployed people be absorbed into the lower and clerical ranks of the civil service as a form of integration into civilian life. This required not only the suspension, if not a complete abrogation, of civil service entry examination procedures but also that men be given employment priority over women as a means of settling the sizzling social and political grievances that were directed against the state. Despite some leaders' expressing their intentions to retain the inherited systems and procedures, which appeared to have worked relatively well, in practice, however, the government introduced substantial incremental changes that reoriented if not entirely transformed the inherited structures (Mac Consaidìn 2014, p. 13).

Another notable civil service reform Act during this period was the Ministers and Secretaries

Act, 1924, which was somehow innovative in terms of laying down the basic contours of the public administrative machinery of the Irish state (Collins and Cradden 2007, p. 19). This Act, which provided the legal basis upon which the civil service including the various government departments it subsumed were anchored, stipulated how departmental responsibilities, jurisdictions, and scope of functions would be defined. Furthermore, this Act rolled back all the various committees, quasi-judicial boards, and commissions, which had proliferated during the British administration – a quiet common modus operandi of discharging executive functions – and incorporated them, as they were, into the pertinent portfolios of the newly reconstituted administrative departments.

Perhaps one of the defining characteristic features of the Ministers and Secretaries Act, 1924 was that it laid down a more elaborate framework for the dichotomy between public administration, which was conceived of as consisting of two categories – namely, the civil service and the public service, on the one hand, and the policy making authority, which came to be represented by the minister and the principal officer or the secretary, on the other. Whereas the civil and public services were comprised of administrative officials who were ultimately responsible for implementing policy by executing the functions of their respective departments, ministers and their secretaries, on the other hand, were responsible for the formulation of public policy of their respective departments. The reforms, although crucial in delineating the roles and responsibilities of each category, did not turn out to be ground-breaking as they did not address the overall civil service management issues other than reaffirming the initial British principle of politico-administrative dichotomy in which an impartial and neutral civil service would implement public policy, which is formulated by elected political officials.

The most pivotal, if somehow, problematic aspect of the Ministers and Secretaries Act, 1924 related to the reorganization and incorporation of the various government departments under a corporation sole. This provision sought, as it did, to invest government departments (and the individual officials at the helm) with artificial legal persona, having the capacity to sue and be sued as legal rather than private individuals. The implication of legal personality or the investiture of legal power and authority upon the minister – and by extension to the department of which he or she is the sole embodiment – is that not only that ministers would now have full control and management over their respective departments but would also be entirely accountable to and fully answerable to the *Dàil Eireann* (Barrington 1980, p. 31). Although the 1924 Act was subsequently amended under Ministers and Secretaries (Amendment) Act, 1939, the provision, emerging in the context of the civil war that undermined the process of nation-building, could be regarded as a unique and radical concept in Ireland of the 1920s.

## Civil Service Reforms of the 1930s–1950s

If the reforms of the 1920s were aimed at state consolidation and regime stabilization, the reforms that appeared in the 1930s proved to be more creative and imaginative in which *Fìanna Fàil*, having come to power following the national election of the 1932, sought to learn from the mistakes of its predecessors in paying greater attention to social policy that underpinned long-term economic strategy (Ferriter 2005, p. 363). As a result, significant financial resources were dedicated to economic development that increasingly relied on economic policies that called for austerity and simplicity. During this time, senior civil servants were called upon to play a leading and central role in defining and devising national development strategy. In particular, from the 1950s onward, the public service began to play a central role – so much so that the process of economic and social modernization of Ireland could not be seen in isolation from the overriding role played by the civil service (Mulreany 2009, p. 3).

A notable legislation during the 1950s, which provided for the regulation of recruitment, tenure, unfair dismissals, and terms of employment and related issues that governed the control and management of the civil service, came with the enactment of the Civil Service Regulation Act 1956.

This reform Act, which underwent a series of amendments, including in 1958, 1996, and in 2005, culminating in a revised and consolidated Act of 2017, was bound by discriminatory clauses against the current and potential women members of the civil service. Thus, for example, under this legislation, women civil servants were not only expected to leave their jobs upon marriage but were also offered limited career development prospects and promotion opportunities. Such discriminatory provisions, which had been seen by rights activists as less progressive and more chauvinistic had its roots in the provisions of the 1925 Civil Service Regulation Bill, in which women were not allowed to sit in competitive examinations that provided admission into the civil service. In fact, under the 1927 Act, they were banned altogether from jury services. Such gross violations, which could be deemed to have served the political interests of state and religious elites stemmed from the worldview of the Catholic Church that was overwhelmingly prevalent in a society that was also primarily characterized by a hierarchically institutionalized male-dominated social order, if not stratified class system.

Discrimination against women remained far from improved with the rise to power of the *Fianna Fàil* government in 1932, either, which raised the stakes even higher by enforcing the early retirement of married women civil servants, especially those working in the education and teaching profession. The employment restrictions placed on married women was not limited to those engaged in the education profession either. Indeed, under the leadership of Eamon de Valera, the *Fianna Fáil* government did introduce a number of bills aimed at limiting the number of positions for women working in the industrial and commercial sectors. The barring of married women from employment – known as the Marriage Bar – eventually came to be instituted in all the civil service under the Civil Service Regulation Act 1956, which provided that "women holding positions in the Civil Service, other than positions which are declared excepted positions under subsection two of this section, are required to retire on marriage" (Civil Service Regulation Act 1956). Although the Marriage Bar for primary school teachers was lifted in 1957, it was not until 1973, following a legislative enactment, which came under the Civil Service (Employment of Married Women) Act, 1973, that the statutory provisions that restricted the employment of married civil servants was repealed.

In the intervening two decades since the introduction of the Civil Service Regulation Act (1956), no comprehensive reform initiatives had been undertaken. Even the 1956 Act itself, which was more of a reaffirmation of the ideals of classic Weberian bureaucracy rather than an attempt at the modernization and transformation of the civil service, represented a continuation rather than a break with the 1924 reforms. Indeed, modernizing forces that propelled the Irish civil service toward more gender equality eventually came both from within and without the civil service, as a result of feminist and women's movements, Ireland's membership into the European Economic Community (EEC), the formulation of innovative trade and economic policies, as well as the introduction of national planning approaches that were based on economic and social partnership agreement frameworks. Indeed, modernizing forces that accelerated the transformation of Ireland's administrative institutions socially and culturally were long in coming following Ireland's acceptance of the Marshall Plan, at the end of the Second World War. This event, for example, required the establishment of new institutions and agencies, including the Industrial Development Authority (IDA) and Board Trachtala, which aimed to promote trade liberalization, economic openness, and foreign investment (O'Hearn 1995, p. 92). Ironically enough, however, with the establishment of these institutions, the British legacy of agency approach to public administration was revived once again, reaching its peak, following Ireland's accession into the European Community in which scores of newly established statutory and quasi-statutory bodies came to operate side by side with central government departments and local government units.

## Civil Service Reforms of the 1960s–1980s

The first major reform initiative since the reforms of the 1920s was introduced in 1969, following

what came to be known as the Devlin Report. One of the key aspects of the report was the realization of the national economic planning and development programs that were spearheaded by the then Minister of Finance – T. K. Whitaker – at the end of the 1950s. T. K. Whitaker, himself, who placed high regard to training and skills development, encouraging his staff to develop competencies even in foreign spoken languages, was advancing reform initiatives, which encapsulated wide-ranging ethos and orientations, including increasing the proportion of staff with economics background and integrating the same into the generalist administrative force of his department (Coghlan 2011, p. 148). In this regard, Whitaker's modernizing reforms could be regarded as the foreshadowing of the Devlin Report.

The Devlin reform package, however, seemed to stand out in stark contrast against the backdrop of the preceding reforms, which it deplored for being "confused, and confusing but long-sustained attempts to centralise responsibility yet depoliticise public business" (Barrington 1980, p. 33). In particular, the Devlin Report, which can be considered the first of its kind in terms of its aims of putting in place comprehensive structural and institutional administrative frameworks, identified two major shortfalls in the public administration system. These pertain to policy formulation as well as inter- and intradepartmental coordination of functions. One of the primary recommendations of the report was the assertion and defense of the artificial dichotomy between policy and administration. The rationale behind this classical orthodoxy, which purported to govern and delineate the activities and relationships between political executives and public administrators was twofold: civil servants must be committed to and guided by the principles and procedures of administration in order to impartially and neutrally implement political decisions that were derived from the public will; likewise, politicians must be committed to and guided by the values and ethos of public will in the formulation and execution of public policy.

Moreover, in an attempt to remedy the confusion of roles and administrative disorganization, the report highlighted the need to "freeing the policy-making function from the mass of detail which now impedes it and at delegating to the executive levels the power of taking the day-to-day decisions" (GOI, Devlin Report 1969, p. 197). The recommendations called for the need to explore and adjust policy making vis-à-vis policy implementation roles in which, on the one hand, the demands of ministerial constituency, parliamentary functions, and parliamentary scrutiny and their ministerial executive detail were accommodated, and on the other, the structural, behavioral, and functional barriers that hinder senior civil servants from playing a policy making role were accounted for. Although the nexus between policy formulation and policy implementation was conceived of as qualitatively split entities rather than as two sides of the same coin, the report was not only inspired by lofty goals but also marked by profound devotion to the values and ethos of public policy formulation and execution. Sadly, the policy recommendations contained in the Devlin Report never got off the ground, much less implemented, leaving behind a yawning reform chasm.

It was not until the mid-1980s that the need to orient the administrative machinery toward the goals of promoting the values of efficiency and effectiveness made itself felt very strongly. These ideas were consolidated in a Government *White Paper: Serving the Country Better* that was published in 1985 advocating for the adoption of a set of management principles that could be applied across the wide spectrum of the public sector. In what appeared to have been a long-established systemic, or at least a patterned practice of shelving, the reform proposal contained in the White Paper were, as with the Devlin Report, never implemented, or at least only partially implemented. As such, the White Paper recommendations never materialized and, if anything, they only seemed to have raised the stakes to transform the structure, organization, and thrust of the civil service very high.

## Civil Service Reform and Ireland's Accession to the European Economic Community (EEC)

The pace of change in the Irish civil service was dramatically accelerated when Ireland joined the

European Economic Community (EEC) in 1973. Ireland's accession to the EEC, which actually began in the 1950s with the signing of the first European Payments Union Agreement, represented a watershed in terms of putting in place innovative and creative administrative frameworks. These encapsulated structural, procedural, and operational strategies adopted in order to deal with the emergent institutional demands and structural arrangements. Thus, for example, the transition from economic protectionism, which defined the fiscal policy of successive governments until the mid-1960, toward trade liberalization was driven by anticipations of EU membership, in which member states were expected to subject their agricultural and industrial sectors to market competition.

The implication of Ireland's membership into the European Community for its civil service is that it represented significant changes in terms of the need to adapt to the pressures and incentives placed by the new EU structures and institutional arrangements, including the realization and implementation of EU policy goals and the attendant challenges of putting in place the necessary administrative frameworks at the local and national levels. If Ireland's accession into the EEC appeared to have been the harbinger of administrative reform, it also represented a formidable institutional challenge for the civil service in terms of handling the administrative and support services, including the coordination and implementation of EU policy and regulatory directives, for which the Irish public service institutions were inadequate to the task (Connaughton 2008, p. 100).

Throughout the 1990s, however, a new picture started to emerge with the establishment of new agencies and cross- and interdepartmental liaison committees that handled the bulk of policy making and coordination activities. Similarly, subcommittees were set up to provide support services, including the conduct of discussion forums, the arrangement of ministerial meetings, analysis of common EU sectoral and regulatory policies, and submission of policy proposals for ministerial consideration. Key among such agencies and cross-departmental committees that were established since the end of the 1990s and early 2000s include the Senior Officials Group, the Interdepartmental Coordinating Committee on European Union Affairs, and the International Division in the Department of the Taoiseach, which all aimed, among other things, to facilitate the coordination of EU-related policies and initiatives both domestically, cross-departmental, as well as cross-nationally.

However, due to the increasingly diffused patterns of responsibility and hence fragmentation of activities and multiplicity of agencies, it soon became apparent that lack of coordination and communication was once again hampering progress, prompting the cliché of "administrative jungle." This state of affairs gave rise to the need for particular attention to be paid to the coordination of EU affairs in which all the various government departments would harmonies and integrate their activities with each other vertically and horizontally, while at the same time broadening the role of the Oireachtas (Legislature) Committee on EU affairs; the latter was established in 1995 with the specific task of overseeing and scrutinizing EU legislative proposals. Similarly, the widely felt need to better coordinate, liaise, and implement EU regulatory policies precipitated the establishment of new agencies, such as the Environmental Protection Agency (EPA) and the Equality Agency.

## Civil Service Reform and the Introduction of Social Partnership Agreement

In what could be seen as a defining moment in the politico-administrative milieu of Ireland, the *Fianna Fàil* party when it came to power in 1987 introduced a tripartite system of collective bargaining called the Social Partnership Agreements. In fact, the forerunner to the present system was developed initially and temporarily in the early 1960s at an enterprise level, as a framework for facilitating pay increase agreements between employees and employers. The acute economic and social crisis of the 1980s, which was reflected in the constant and increasing levels of unemployment, mass emigration, and industrial unrest, formed the backdrop against which a

comprehensive social and economic program could be effectively mobilized and implemented. This involved the construction of a framework in which an ensemble of state and nonstate actors, including representatives of trade unions, employers, employees, farmers associations, as well as voluntary local community groups, can bargain collectively. Particularly, by formulating a 5–10-year tripartite system of national wage agreements across civil society and the economy, the state aimed to find ways of coordinating and creating an inclusive government in which macroeconomic stability, competitiveness, private investment, and sustained growth could be accelerated. Similarly, in the sphere of industrial relations, the social partnership agreements sought to maintain consensus in collective bargaining and collective agreements, including social welfare policies with the view of promoting issues of equality and social justice.

In so far as the social partnership framework has been purely driven by consensus building and interest integration strategies in which the state plays a dominant role in effecting agreements among key stakeholders over sectoral and national socio-economic policy goals and objectives, the approach can indeed be characterized as a corporatist policy and decision-making process. Furthermore, and by the same token, to the extent that it has been permeated by corporatist arrangements in which clientelistic policy networks distribute state resources in an environment of asymmetrical information and power structures, the framework is fraught with problems. The implication of social partnership framework to civil service reform is that it reinforced and indeed expanded the policy making scope of senior civil servants at the national and local government levels, trekking down the various statutory agencies and voluntary community groups. The approach has been standardized and firmly and formally institutionalized reaching down the local level under a unique and innovative scheme called Area-Based Response to Long-Term Unemployment. With the creation of what came to be known as Local Development Companies, the framework brought together a wide variety of community and voluntary groups.

Similarly, as the framework "trickled down" the hierarchies of statutory and nonstatutory institutions, it facilitated the development of a holistic public management and modernization strategy, which has been embedded and mainstreamed into basic community development programs and initiatives. Indeed, as a result of the adoption of the partnership frameworks, the Irish administrative system has been made to adapt and respond to the requirements of the new structural and institutional environment not only in terms of administrative and bureaucratic density but also in terms of technical capacities in relation to public policy making, policy analysis, implementation strategy, planning, control, and evaluation mechanisms. Furthermore, to the extent that the social partnership approach is underpinned by a modernization agenda, it anticipates the adoption and demonstration of innovative management practices and performance measures that must be employed across the wide spectrum of the public sector.

Likewise, in so far as the civil service is tasked with ensuring the progression, continuity, and coordination of the partnership agreement framework, it has created a mechanism for the state to ensure the development of the quality and effectiveness of the public sector, including the expansion of its institutional framework, promotion of its structural adaptation, as well as building its leadership, administrative, and policy making capacity. Thus, for example, since the introduction of the social partnership framework in the 1980s, the government had been setting up a number of new institutions, which bore common structural denominators that underscored the integration and consolidation of the national social and economic policy objectives. Some of these coordinating and monitoring institutions include the National Centre for Partnership and Performance (NCPP), the National Economic and Social Council (NESC), the National Economic and Social Forum (NESF), and the National Economic and Social Development Office (NESDO). All these institutions specialize in the production and dissemination of scientific policy research and analysis and render consulting and advisory support services. Whereas the NESDO provides policy guidance (in addition to being ultimately

responsible for the coordination of the above three agencies), the NCPP is focused on rolling out and maximizing the impact of the concept of partnership at operational and enterprise levels, within and outside the workplace, including local development agencies. Despite the proliferation of administrative and statutory agencies and multiplicity of activities, and the challenges they pose in terms of coordination and synergy, the partnership framework has stimulated innovative and transformative set of organizational and institutional arrangements in addressing a wide range of socio-economic and development issues.

## Civil Service Reform and the Introduction of Strategic Management Initiatives (SMI)

Enter the 1990s, and it was a time of explosive changes as far as civil service reform is concerned, culminating in the introduction of what came to be known as the Strategic Management Initiative (SMI). Inspired by New Public Management principles, these set of reforms were launched in 1994 by the then Taoiseach, Albert Reynolds. The main thrust of the SMI framework was to enhance the capacity of the public sector in order to play a vital role in national development and deliver a responsive and quality service to the public by ensuring the effective and efficient use of resources. Under these reform proposals, which were supported and accentuated by a corollary set of reform proposals – which came under the theme *Delivering Better Government* – that was published in 1996, every Government department was expected to formulate a strategy, under the guidance and support of an internal committee of secretaries appointed by the minister.

The main objective of *Delivering Better Government* was to ensure the development of effective and efficient civil service and administrative structures that emphasize public expectations with the delivery of excellent service. To achieve this, each government department was required to make a thorough inventory and examination of its baseline operations with the aim of improving departmental efficiency and coordination framework so as to meet government objectives. Specifically, under this reform initiative, departmental strategy, which must be prepared once every 3 years, was to contain a comprehensive benchmark outlining the activities to be pursued and the rationale behind them, including the formulation of a program of reform options.

The civil service reforms during this period were said to have been ground-breaking and indeed foundational as they started to experiment with corporate governance approaches that place greater emphasis on transparency and accountability. The SMI, which drew theories and practices from the private sector and indeed from the experience of other countries, with the ultimate goal of transposing the same into the public sector, was guided by the imperatives of strategic management foundations of public service. These required, as it were, the need for capacity building and increasing the opportunities for mobility within and outside the public sector. As such, the reforms sought to bridge the public–private divide thus allowing greater transference of skill and expertise across the public sector, the community, and the private sector. Furthermore, the introduction of the Strategic Management Initiatives (SMI) set in motion a chain reaction of complementary reform proposals that were devoted to issues of performance management, evaluation and performance rating, and customer service quality and efficiency. Some of the corollary elements of the SMI reforms include Management Information Framework (MIF), Performance Management Development System (PMDS), Regulatory Impact Analysis (RIA), Quality Customer Service, Value for Money Evaluations, and Output Statements. Yet, most of the reforms that were introduced under the rubric of SMI/DBG appeared to have been marked by undue concentration on personnel inputs and management processes rather than on output. Moreover, although much has been achieved to address the operational deficiencies and coordination problems since the second half of the 2000, this period was also marred by the most commonly voiced criticism of the administrative system, which pertained to the highly centralized decision-making process in which the most senior civil servants had been

made to play a predominantly subservient role in relation to policy formulation.

## Civil Service Reforms of the 2000s–2018

Ireland witnessed a rapid economic growth from mid-1990s throughout the first half of the 2000s, which was comparable to growth levels recorded by the four Asian Tigers, hence earning Ireland the epithet "Celtic tiger." Indeed, it was a period in which economic growth was boosted by strong consumer demand for housing, which bubbled the property market, fuelling, in turn, employment in the construction industry and financial sectors. The changing socio-economic environment of the time generated the momentum for policy reforms and it was during this time (or at least not far removed from) that a number of ancillary legislative and/or amendment reform Acts were being advanced and enacted. Thus, for example, many legislative Acts, including the Organization of Working Time Act, 1997; the Employment Equality Acts, 1998–2015; National Minimum Wage Act, 2000, the Parental Leave Acts, 1998–2006; the Safety, Health and Welfare at Work Acts, 2005 and 2010; and the Protection of Employment Acts, 1977–2007 were driven by the current economic and employment conditions. The central thrust of most of these reforms was to ensure compliance with relevant national and international labor laws aimed at protecting and safeguarding the rights of workers, employers, and trade unions.

The financial downturn of 2008–2009 marked the culmination of the deepest global economic crisis, the like of which was never seen since the Great Depression of the 1930s. Indeed, what was initially supposed to be a credit crunch soon morphed into a full blown global financial crisis accompanied by a severe recession that had significant and adverse effect on the economies of several countries of which Ireland was the hardest hit. For Ireland, in particular, the economic burst was soon followed by a property market collapse, giving way to a dire recession, which spiraled into a near total economic meltdown. This produced the conditions for a huge stimulus spending and government borrowing aimed at bailing out Ireland's banks and major financial institutions, which "suddenly" found themselves incapable of refinancing their debts. Furthermore, the sharp dip in economic growth resulted in a steep rise in unemployment, with employment in the private sector, in particular, decreasing sharply as many businesses were forced to close down or massively retrench the size of their labor force.

In the public sector too, it triggered a chain reaction of changes that led to the radical restructuring of the fiscal and financial framework of the public sector, leading to cutbacks in public spending on social services, including social welfare programs, health services, social housing, and education. Furthermore, driven at least in part by cost-saving and efficiency gains as by the desire to promote performance improvements, a number of government agencies were retrenched in what came to be known as a process of de-agencification. This strategy of restructuring and downsizing involved the merging and integrating of public bodies under a new program of joined-up government. Furthermore, in an attempt to bridge its growing fiscal and budgetary deficits, the Irish government had to incur unsustainably high levels of sovereign debt that accrue high market interest rates. The effect of bankruptcy and stagnant economy was that revenues shrank while national debt swelled. Consequently, this led to the introduction of fiscal consolidation measures, in which austerity and moratorium packages would be put in place, causing all new recruitments to the public service to dwindle to a trickle.

It was within the context of dire economic circumstances that the first set of reform proposals were presented in 2011, coming under the rubric of Public Sector Reform Plan 2011–2016. The reform plan, which was triggered, as it were, by the looming economic crisis, and hence by the imperatives of creating a sustainable fiscal position, had five major objectives vis-à-vis the promotion of efficiency gains by streamlining existing services, alignment of shared services and projects by establishing common senior management teams and shared procurement and delivery strategies, as well as the introduction of innovative and cost-effective technology, which involved e-government and information and

communication technology (ICT) strategies. The reform proposal was drastic in terms of its consequences, which resulted in a reduction of 37,500 staff, bringing the total numbers to 282,500, by 2015, down from 320,000 in 2008 (DPER 2011). The reform framework was also extensive enough in terms of content, process, and coverage, creating enhanced visibility and awareness of the reform agenda across the wide spectrum of the public service.

The reform plan was deemed to have been substantially permeated by strategic planning and project management thinking, which was enhanced by a reporting mechanism – a key ingredient in ensuring increased levels of accountability. In an evaluation report conducted by the OECD, it was noted that overall, the Public Service Reform Plan 2014–2016 was effective in creating a model for interdepartmental network structures, allowing the sharing of experience and learning opportunities (OECD 2017). For all its success and acclaim, however, the reform plan was not without its problems. In particular, the OECD was highly critical of some aspects of the reform, viewing them as ultimately driven by cost reduction and efficiency gains, which provided the underlying rational for public service cross-cutting. Furthermore, the assessment report suggested several recommendations that highlighted the need to shift the reform focus from a process-oriented toward output-oriented perspectives.

## Conclusion

The fundamental contours that formed the basis of the modern civil service system of Ireland were shaped by a long-established British legacy, whose governmental and administrative institutions and structures continued to have a lasting and enduring influence on current processes and praxis. Yet, if the fundamental principles of the Irish civil service system have stood the test of time, they have also been constantly adjusted out of the need to effectively respond to the unique and peculiar national, political, and social circumstances, not least of which the imperatives of nation-building and state-formation were key parameters. One of the initial reform efforts that were undertaken following the foundation of the Irish Free State, in 1922, were largely occasioned by the need for regime security and stability, which was best thought to be achieved by demobilizing and integrating the former soldiers of the civil war into the ranks of the civil service. Similarly, the prolific extra-departmental agencies, quasi-independent statutory boards, authorities, and commissions, which changed hands in response to the prevailing political reality at independence had to be centralized and put into the newly configured government departments. Although such structural and functional anomalies led to the introduction of the Ministers and Secretaries Act, 1924, which conferred the minister with a corporate sole status, the most commonly voiced criticism of the approach was that it resulted in a decision-making system that was highly centralized, offering the most senior civil servants fewer incentives to focus on the wider issues of public policy formulation.

But perhaps the most overlooked reform area was the employment and equal rights of women civil servants, which could be pointed out as negative aspects of the civil service reform experience of Ireland during the 1950 throughout the 1970s. Indeed, it was not accorded the attention that it deserved, in terms of protecting women's jobs, providing a welcoming work environment, fair treatment in the workplace, and equal employment and career development opportunities. Of course, Ireland has made significant improvements in the present in terms of increasing the representation of women in the top echelons of the public sector, but much remains to be done in order to promote female leadership and gender parity at all levels of the public service. Similarly, the minister-oriented behavioral norms and power structures have increasingly been seen to impose duty and a higher expectation on civil servants in terms of demonstrating responsiveness to the exigencies of political leaders and their executive functions.

The uniqueness and idiosyncrasy of the single-minded application of the principle of independence and political impartiality, which forms an essential component of the structure and

organization of the civil service system of Ireland rather creates an "administrative myopia." Whereas the most senior civil servants are not only unable to gain autonomous space for policy analysis and reflection, but also lack the legal and institutional framework within which they could play their true role, "namely to have the courage to tell the emperor if he has no clothes" (Mulreany 2009, p. 8). Alternately, those who work at the frontline of the administrative field become myopic as they cannot anticipate "the broader policy issues that arise from their day-to-day working experiences" (Boyle 2009, p. 17). By and large, despite the plethora of reform initiatives wrought within the civil service, and, which, as a result, have been making innovative inroads against the inherited framework, and seemed to have produced a branching, if not a separate trajectory, there is still so much that remains the same.

Administrative changes; Changes; Collaborative governance; Governance; Malaysian public sector; Public sector reform

## Introduction

Malaysia has embarked on several ambitious transformation programs to improve policy design and delivery. One of its policy initiatives is the National Transformation Programme (NTP) which comprises of the Government Transformation Programme (GTP) and the Economic Transformation Programme (ETP).

This chapter examines the role of a unit tasked to carry out the NTP – Malaysia's Performance Management and Delivery Unit or Pemandu, in short. Specifically, this paper concerns Pemandu's role as a collaborative agent and its dealing with relevant stakeholders in delivering administrative reform (see section "About PEMANDU").

The Malaysian example underlines few essentials to administrative reform efforts. First, it highlights the importance of institutional design when dealing with collaborative governance and how institutional design remains a function of context. Second, the case highlights issues that are essentials to facilitate or inhibit the process of collaborative governance (see section "Designing the Collaborative Process"). Third, the Malaysian example demonstrates the numerous challenges that states face at institutionalizing administrative reform, specifically collaborative governance. It drives home the point that to make deep-rooted administrative changes, one needs to be cognizant of issues of bureaucratic culture and idiosyncratic political arrangement (see section "Collaborative Governance").

This chapter is divided as follows. The first part provides various definitions and discussions on collaborative governance. The next part discusses the role of Pemandu and how its various processes have unintentionally laid down the importance of collaborative governance in the Malaysian bureaucracy. The final part provides discussions on collaborative governance in Malaysia and highlights various issues that are impeding or facilitating the collaborative governance endeavor.

## Collaborative Governance

There are many definitions to collaborative governance, but the definition that we will adopt here is that collaborative governance encompasses a range of processes and structures of decision making, regulation, and management that see the involvement of multiple actors – be they government agencies, private actors, and nongovernmental organizations – for the purpose of designing and realizing public policy (Ansell and Gash 2008).

## About PEMANDU

PEMANDU (the Performance Management and Delivery Unit) was set up in 2009 and it is fashioned after the United Kingdom's Prime Minister Delivery Unit (PMDU). Its primary mandate is to implement the Government Transformation Programme (GTP). The unit is tasked to work closely with the bureaucracy to deliver on the agreed NKRA and this is done by defining the targets, tracking improvements, and employing various mechanisms to achieve the stated goals. Unlike other administrative outfit in the bureaucracy, Pemandu is given a fixed life span; it will cease operation in 2020, the year when Malaysia expects to achieve a high-income economy.

Structure-wise, Pemandu occupies a unique and unprecedented position within the bureaucracy. Even though it is a unit under the Prime Minister Office (PMO), it behaves more like an autonomous unit, independent of the civil service code. Pemandu's Chief Executive Officer, Idris Jala, reports directly to the Prime Minister and not to the head of the Malaysian civil service, the Chief Secretary of State (Antony et al. 2016: 87). In fact, Idris, for 4 years, assumed the role of a cabinet minister, being made a full minister until 2015. This is unprecedented because under normal circumstances, administrative units in the bureaucracy are headed by directors who are civil service appointees, not cabinet ministers.

Pemandu has other qualities that are uncharacteristic of a unit under the Prime Minister Office. Pemandu, for example, conducts its own hiring process. Recruitment of officers is not managed by the civil service's central personnel department. Also, Pemandu officers' remuneration packages do not follow the civil service scale. On average, these officers are paid higher than those in the civil service. One reason for that is to obtain experienced and well-qualified officers to helm Pemandu, the unit needs to provide a pay packet that is competitive and aligned to the private sector. But the higher pay comes with more demanding employment contracts where renewal of contract is based on the officers' ability to deliver on key performance indicators (KPIs). The competitive pay packet allows Pemandu to

hire the best talent from the private sector; in fact, almost 80% of Pemandu officers came from the private sector. These officers are usually sourced from big consultancy firms and they often have with them years of experience. So distinctive is this arrangement that the World Bank describes that replicating the Pemandu model elsewhere would pose challenges saying that "not all countries will be able to get exemptions from the civil-service structure" (World Bank 2017: 47).

To carry out its mandate, Pemandu has drawn up a comprehensive plan in which collaboration is heavily featured. Under its "Eight Steps Transformation" programme, three initiatives involve collaborative undertaking, specifically workshops involving cabinet ministers to establish strategic direction, coordinating bottlenecks, and convening social labs that involve various stakeholders. We discuss this next (see sections "Pemandu and Its Collaborative Effort Involving Cabinet Ministers" and "The Social Labs").

## Pemandu and Its Collaborative Effort Involving Cabinet Ministers

One of the main features of Pemandu-led initiatives was its organization of a workshop for cabinet ministers. The workshop turned out to be an important foundation to Pemandu's role as a collaborative agent. It helped Pemandu achieved two important things. First, it promoted buy-ins from cabinet ministers to the various state initiatives. Convincing cabinet ministers of the merit of the workshop and collaboration is so important because without it Pemandu would have with stiffer resistance from the bureaucracy in running its programs. Second, the workshop forged inter-ministerial cooperation. At the end of the 6-week-long workshop, ministers started to see the interrelatedness of the change agenda across the ministries that provided an important currency to Pemandu's future collaborative efforts.

During the workshop, the cabinet ministers were tasked to map a comprehensive plan to identify key areas to improve public service delivery and accomplish Malaysia's vision 2020 goals. In the initial stages of the workshop, obtaining buy-ins from cabinet ministers was a challenge because the ministers were not convinced of the value of the project and that issues in one ministry could be tied to issues raised in other ministries.

To ease their collaborative efforts, the ministers were provided with information from surveys and dialogues sessions obtained from various members of the public and they ministers were constantly cajoled by consultants to look beyond their individual ministry's concerns when identifying critical policy concerns and goals. To facilitate collaborative tendencies among them, the conveners urged ministers to adopt a "backward" strategy in addressing policy issues. This strategy encouraged participating ministers to first identify policy goals and then to work backwards to search for ways that could best achieve the policy goals. In adopting the "backward" strategy, the consultants helped nudge the ministers to design a collaborative solution with different agencies for optimal policy outcome.

Another feature of the workshop that facilitated collaboration was that the workshop had the heavy presence of the prime minister. The prime minister's presence provided the right signal to the ministers on the seriousness of the workshop and collaboration. The distinctive quality of the Malaysian bureaucratic culture where power distance is high means that the presence of the prime minister inevitably induced reciprocal commitment on the part of the cabinet ministers to treat the collaborative project with greater intensity and seriousness.

By the end of the 6-week-long workshop, the cabinet ministers were bought into the idea of collaboration. One evidence of this was when the ministers became champions of Pemandu's future social labs. When needed, they urged department heads of their respective ministries to send their very best officers to attend Pemandu's various social labs. In a collaborative mood, the ministers also agreed, at the end of the workshop, to establish six important policy goals, called the National Key Result Areas (NKRAs). They agreed to appoint six ministries as leading or coordinating ministries with the other ministries collaborating in ensuring the delivery of the policy goals.

Pemandu's ability to design techniques to optimize collaborative tendencies amid a distinctive Malaysian bureaucratic culture is worth mentioning here. In designing its initiatives, Pemandu understood Malaysia's bureaucratic culture which is high on collectivism (Hofstede 1980: 35). This is a condition when bureaucrats tend to display in-group cohesiveness, collective distribution of resources, and collective action. (Kennedy and Mansor 2000: 7). Pemandu understood the presence of "perverse equalitarianism" prevalent among Malaysian bureaucrats, one where being too direct or forthright are not considered virtue and perceived as insensitive or rude. Under such conditions, in group settings, members tend to forego openness in the interest of maintaining social harmony. Individuals tend to be conformist for fear that if they take excessive initiatives, they would be seen as insensitive and rude and hence subject to ridicule and kept down to size by group members. Given the possibility that ministers (especially junior ones) might subscribe to such "perverse equalitarianism" and suppress their opinions or ideas, Pemandu adopted the blind voting system. Ministers were first told to be as unrestrained as possible with their ideas even if the ideas were "absurd." After the lively discussion, the ideas were put to blind voting. Indeed, the blind voting technique promoted confidentiality of opinion and helped identify priority areas of concern. With such initiatives, ministers could freely rank their choice without inhibitions. It provided the ministers with a better sense of the most pressing issues of strategic interest and encouraged them to adopt the collaborative imperative (Deepa Iyer 2011a: 4–6).

Pemandu's ability to convince the cabinet ministers and the various ministries, departments, and agencies (MDAs) on the merits of collaboration is unprecedented in Malaysia's public sector reform efforts. Another quality of Pemandu's collaborative endeavor is its establishment of a set of processes to promote collaboration. We turn to this next.

## Designing the Collaborative Process

To settle disputes and resolve bottleneck issues on agreed upon policies, Pemandu designed mechanisms that incorporated elements of collaboration while at the same time taking into account Malaysia's bureaucratic culture. One of the first initiatives was the setting up of the Delivery Management Offices (DMOs), which are housed in each ministry. The DMOs act as coordinating agency to ensure the delivery of the National Key Results Areas (NKRAs) as planned. They act as first touch point in settling bottleneck issues that arise because of competing interests or due to institutional constraints. And, in true collaborative mode, the DMOs are made up of Pemandu officials as well as officials from the various Ministries, Departments and Agencies.

Besides DMOs, Pemandu also designed several administrative layers to escalate outstanding issues which are heavy in collaborative elements. Issues that remain unresolved by DMOs were first brought to a technical working group for resolution. This working group comprised mainly of members from the leading ministry and members from institutions relating to the issue with Pemandu assuming the advisory role. Should the problem remains unresolved, the issue would then be brought to a steering committee which comprised of relevant ministers, secretary generals, directors-general, and CEOs from important ministries and agencies. If the issue still remains unresolved, the matter would be brought to the Problem-Solving Meeting (PSM). This meeting is held twice a year and is chaired by the Prime Minister. Usually though issues would be resolved at the steering committee stage; only rarely did the issue be brought to the PSM (World Bank 2017).

A feature in the design of Pemandu's dispute or debottlenecking mechanism is that it takes into consideration Malaysia's bureaucratic culture, a culture that is not naturally predisposed to interministerial collaboration. Pemandu had to negotiate serious issues of group dynamics among bureaucrats – that of "face saving" or members' avoidance of group conflict. Such nature of group dynamics was well understood by Pemandu's CEO, Idris Jala. When he chaired meetings, Idris ensured that Pemandu officials played a non-intrusive role. To get people to think of solutions, Idris drove the message to participants that the solution to issues were already there with them,

reiterating that "the good ideas are already there, and people know these ideas, but the reasons we don't move from ideas to results is because there are technical, political, administrative, process, system hurdles" (Iyer 2011a: 9). In essence, Pemandu understood the group dynamics and merely nudged participants to resolve issue using their collective resources.

To make for better monitoring, there were also weekly, monthly meeting as well as the twice yearly meeting chaired by the Prime Minister that all bear the collaborative imperatives. The weekly meetings – involving each of the NKRA team, delivery management office staff and other key members of the delivery chain – were meant to enable team members to be on the same page when it comes to outstanding issues and goals. The twice-yearly meeting is a six-eye meeting involving the Prime Minister, the minister leading the project and Idris Jala, Pemandu's CEO. During such meetings, progresses were reviewed using data compiled by DMOs. A dashboard system was employed where performances were assessed using a green, yellow, and red rating; with green signaling, that progress has been made while red conjures the opposite. The meetings are important tools to consolidate the collaborative framework, monitor the progress made, and ironed out outstanding issues. In commenting on the meetings, one Pemandu officer said that "although Pemandu engages with the ministries on a daily basis, these weekly problem-solving meetings with the higher management and the monthly sessions with the PM meant that little would fall through the cracks" (Iyer 2011a: 10).

To sum up, the design of Pemandu's delivery process indeed portrayed the many challenges as well as the idiosyncratic techniques used to promote collaborative governance. One important lesson to be drawn here is that any design of the collaborative framework needs to take into account institutional quality, where in the Malaysian case, it is one that is characterized by silo thinking, high power distance, collective thinking and bureaucrats' nonconfrontational disposition when implementing policies. Besides the process, Pemandu employed another tool to promote collaborative tendencies – that of social labs.

## The Social Labs

Pemandu-organized social labs were aimed at translating the broad targets of the six key policy areas (NKRAs) into tangible goals. The labs consisted of officers from the various ministries and agencies. These officers were handpicked and deemed to be the best of their cohorts. They had the full backing of their respective ministers. When there were occasions when heads of department were reluctant to send their top officers to attend the 8-week-long lab sessions, the cabinet ministers were on hand to intervene and gave orders to the various agencies to send their best officers for the lab sessions.

The lab sessions were intense and inclusive. Participants were expected to look beyond the immediate concerns of their respective ministries in coming up with solutions and to do that they were told to start with a blank canvass and move from broad policy goals to more specific targets. This process is described by Pemandu's CEO Idris Jala as "going from 3,000 feet to 3 feet." It involved "starting with the big picture and sharpening the focus to inspect its smallest detail" (Iyer 2011b: 6).

Participants were told to adopt an iterative and recursive approach when coming up with specific targets. To do so, participants needed to revisit old assumptions, raise new information, and reconfigure earlier targets and plans (Charles and Jordan 2015). To assist them in making policy prescription, participants were given views from the public, collated from interviews, online feedback, and text messaging (Iyer 2011b: 6). The ultimate aim of this process was to induce collaborative tendencies, for participants come to know and trust one another and bring to the fore knowledge of problems or solutions that, at the outset, they may have held closely to themselves" (Charles and Jordan 2015: 19).

The lab participants were also made to present their plans to senior officials from two key agencies – the Ministry of Finance (MoF) and the Economic Planning Unit (EPU). Called the "stress test," the lab group presentations were attended by ministers and senior government officials where participants were queried on the

details of their plans and how they weighed the proposals against financial and administrative limitations. Indeed, the lab sessions aided the collaborative process as it did away with hierarchical concerns and promoted more lateral network settings. Pemandu's insistence on the recursive and iterative approach to policy prescription and the informal nature of the lab sessions encouraged participants to make realistic judgement of policies as well as forced them to look at issues from a multi-sectorial perspective. What is equally important is that the interactive dialogues and the iterative approach to policy making helped promote buy-ins from stakeholders. As one Pemandu officials mentioned, the "lab is an environment where hierarchy is set aside. We encourage participants to leave their 'organisational hats' outside the door. It empowers civil servants, giving them a chance to voice ideas that may have been in the works for years" (Iyer 2011a: 7).

Indeed, the lab sessions helped the collaborative process. They became sites for stakeholders to bond and make realistic assessment of each agency's strengths and weaknesses before coming up with tangible targets. Indeed, the inclusive nature of the sessions enhances accountability and improves the legitimacy of policy decisions. The whole process also helps generate trust among the multiple stakeholders and to make participants move beyond each ministry's parochial concerns. In fact, participating officers admitted that the lab sessions trained them to decide on socially desired outcome from a collective standpoint. Indeed, Malaysia's collaborative governance exercise provided us with qualities needed for more effective. We turn to this next.

## Highlights of Malaysia's Collaborative Governance: A Permanent Feature of the Malaysian Bureaucracy?

One important takeaway of Malaysia's collaborative governance exercise is that reform can be made by tweaking existing institutional arrangement. Pemandu's ability to operate alongside existing bureaucracy is indeed unprecedented. Indeed, this ability by the state to establish a delivery unit that did not strictly conform to existing bureaucratic code help ensured that changes were done quickly. This is an important point because - without Pemandu - instituting reform using existing bureaucracy would be far slower as bureaucracy tends to have institutional inertia, one where bureaucrats tend to stick to traditional bureaucratic practices than make radical change. Indeed, the fact that Pemandu is not bound by institutional compliance expected of a typical bureaucracy allowed it to make bold reform efforts quickly.

Another important takeaway of the Malaysian experience is that Pemandu's near autonomy provided it with a unique resource combination that makes it possible to engage multiple stakeholders in the various collaborative projects (Huxham and Vangen 2000: 1171). Pemandu's unique positioning, the temporary nature of its existence, its direct access to the prime minister, and its independence in terms of recruiting the best from the private sector have all facilitated the collaborative endeavor. It is this unique arrangement that differentiates Pemandu from other delivery units and one that the World Bank admits would be hard to follow.

The Malaysian example also highlights the importance of context, specifically the imperatives of bureaucratic culture when designing collaborative governance. Malaysians' collective tendencies when it comes to decision making, bureaucrats' deference to authority, and the prevalence of perverse egalitarianism in collective setting all point to the need to craft unique and clever processes and techniques to maximize collaborative tendencies. Pemandu's adoption of the blind voting system, its design of several tiers of dispute settlement mechanisms, the heavy involvement of the Prime Minister in workshops, the firewalling of Pemandu's operation from the rest of the civil service, the use of recursive and adaptive measure to policy prescription, and the employment of horizontal integration through the use social labs suggest the need to craft unique mechanisms for effective collaborative governance to work. Indeed, a nuanced

understanding of bureaucratic culture is essential for collaborative governance to work.

Finally, even though collaborative governance could lead to more deliberative democracy, a caveat is warranted here. There remains outstanding issues in Malaysia's experiment with collaborative governance. Institutionalization of collaborative governance in Malaysia is still work in progress. Pemandu's achievements in driving results through collaborative projects are still uneven. Take for instance, the unit's effort to increase rice production by amalgamating agricultural land of small holders in northern region in Malaysia. The project, which involved collaboration of government agencies as well as cooperatives, did not meet its target mainly because farmers did not see the benefit of a collaborative arrangement. Despite Pemandu targeting that come the year 2020, 50,000 hectares of paddy fields in Malaysia's northeast region would be amalgamated and operated under estate farming method, by end 2014, only about 20,000 hectares had been amalgamated, translated to about 40% of the targeted goal. The low take up rate is even perplexing because despite participating farmers seeing their income improving due to better yields, amalgamation rate remains low. One possible reason for this is the issue of trust. This is reflected in its annual report when Pemandu acknowledged the administrative challenges it still faced in implementing the paddy projects. Its report highlighted that not all farmers enjoyed these benefits [higher income] because they chose not to implement the Standard Operating Procedures. The report also mentioned that farmers were reluctant to use new technologies and adhere to internationally proven agricultural best practices method. Issues of trust also seems to surface when the report acknowledged that nonamalgamated farmers did not see any need to be part of the project because they were already seeing increasing yields from using new technology. To add, Pemandu also highlighted legal and administrative issues it was experiencing with the farmers – underlining yet again issues of trust. In its report, Pemandu acknowledged that the construction of irrigation infrastructure ran into problems due to issues of land acquisition. Pemandu also mentioned that its intention to introduce a special purpose vehicle to manage the industry's entire value chain was now put on hold because the "state of operational readiness is yet to be established" which, it admitted "hinder fruitful collaboration."

Also, Malaysia's collaborative governance endeavor might be stalled. It is still unclear whether collaborative governance would be sustainable given Pemandu's temporary status. Pemandu is already making exit plans to retrench its role as an agent of change. Given such an arrangement, the legacy of collaborative governance could fade with Pemandu's absence. There is of course the possibility of replicating Pemandu's role in the civil service, but without Pemandu's unique authority line, there is a possibility of "conflicting agency goals and missions, inflexible administrative and legal procedures and constrained financial resources." (Purdy 2012: 409).

## Conclusion

The Malaysian example points to the importance in appraising state-society structure when designing collaborative governance. Pemandu's unique organizational design and organizational positioning within the bureaucracy, its direct access to the prime minister, and its exclusive recruitment and talent management programs that lie outside the civil service structure have made it easier for it to drive programs and attract critical stakeholders to buy-in on its collaborative endeavor. This arrangement is difficult to replicate elsewhere. As the World Bank report suggests, few countries would tolerate a unit, like Pemandu, that enjoys exemptions from the civil service salary structure. (World Bank, 47).

Collaborative governance, however, remains a nonsystemic feature of Malaysia's administrative reform effort. This is because the noncentrality of collaborative governance in the overall national transformation program means that institutionalizing collaborative governance will be a challenge. Pemandu's exit plans and the gradual

retrenchment of its mandate could only mean that administrative instruments that support collaborative governance could likely be dismantled if there is lack of political will.

The Malaysian case also highlights that trust, or the lack of it, could inhibit the institutionalization of collaborative governance. Trust relates to concerns like legitimacy and commitment and the lack of it interferes with the idea of shared motivation that is so necessary in collaborative governance.

# Administrative Resilience: Potential Approach for Disaster Management

Md Nazirul Islam Sarker
School of Public Administration,
Sichuan University, Chengdu, China

## Synonyms

Absorptive capacity; Adaptive capacity; Adaptive governance; Administrator's response to the disaster; Community resilience; Livelihood resilience; Organizational resilience; Resilience; Socio-ecological resilience; Transformative capacity

## Definition

Administrative resilience is the ability of the administrative system to provide appropriate measures to uncertainties and bounce back to previous conditions after facing risks, shocks, disasters, and other threats to organizational stability. It also enhances the ability of social systems to remain stable during and after times of adversity.

## Introduction

A vulnerability regarding climate change is increasing all over the world. The importance of policy and governance of climate change is increasing day by day. Peoples are living in an interconnected and complex world. Complexities among social, ecological, and administrative system are gradually increasing due to gradual changes in the environment. So, there is a big concern about the disruptive effects of the ecological system on social and administrative system. Due to the massive adverse effect of climate change and natural disasters, its management is a prior concern to the public administrators and policymakers all over the world. Development

scientists usually suggest that mitigation and adaptation are the key tools for the management of climate change and natural disasters. Resilience is a potential approach to deal with a socio-ecological and administrative vulnerability which enhances the capacities of the system for mitigation and adaptation (Folke 2006).

The term "resilience" is derived from the Latin word "*resiliens*" that means "to bounce back" or "to rebound" (Harper and Speed 2012). It also means recuperation from depression or illness in psychology and medical sciences. Resilience refers to the capability to regain the previous state or original state after facing calamity or change. Generally, it focuses on the capacity to regain or bounce back to the original state after facing adverse events. Resilience is a tool to return to the original state after facing vulnerability. Traditionally, it was used as a term "invulnerable" due to the gradual acceptability of the term by the various disciplines; it becomes resilience by replacing "invulnerable."

The concept of resilience is quickly gaining acceptability in the practices and researches in public administration. This interest of resilience among public administrators and scholars requires a better understanding of this issue to understand and solve the problems of relatively complex, fragile, and interconnected socio-ecological systems and legitimate governance. Administrative resilience is a potential tool to make resilient public administration which is different from traditional Weberian bureaucracy. Resilient public administration consists of non-hierarchical network, the capability to respond in a crisis; depends on interdisciplinary knowledge, information sources, and stakeholder participation; and also uses social learning and develops policy accordingly to manage risk, threat, and disaster events (Milley and Jiwani 2014).

## Complexities of Systems

The main characteristic of the socio-ecological system is its multi-scale nature of the structure of the social system. People are the main actor in the system who engages themselves with various components of the system like resource management, norms, values, and pattern of consumption. Governance is a process to shape the system as usual and prevent undesirable circumstances or recover from adverse events. An effective policy decision requires a proper understanding of the interaction among social, ecological, and administrative system. Generally, the dynamics of the socio-ecological system is dependent on the changing nature of the elements of both systems. Since climate change effects are increasing all over the world and cause various natural disasters, it affects equally to the social system. Administrative system is governed by public administrators, so they are responsible to manage any events occurred by the dynamics of social and ecological systems. Administrative resilience is a tool to capable the administrative system for responding to the dynamics of socio-ecological systems.

## Administrative Resilience in Public Administration

Resilience is considered as the most effective approach to solving administrative problems emerging from dynamic socio-ecological systems. Resilience generally focuses on the ability of a system, organization, or society to withstand or recover from the effect of natural hazards. It also reveals the organization's capacity to survive an uncertain and risky situation gaining experience from the past and solving the future. Resilience is now gaining popularity in policy goals as a metaphor for the expected condition (Manyena 2006). Scholars and practitioners of public administration are now turning attention to administrative resilience as a systemic way for organizations to cope with shocks, risks, vulnerability, and adversity of natural hazards (Manyena 2006). It provides an opportunity to deal with uncertain situations in a better way of preparation, dealing, and adaptation. Since the 1980s, the concept of resilience has been used in emergency preparedness and management (Baker and Refsgaard 2007) and natural resource management (Haase 2009). Hood (1991) introduced the

concept of resilience in public administration in the 1990s as a neglected concept which conflicted with "efficiency" to the previous administrative interest. But in 2000, resilience gained popularity in public administration to address the vulnerability, shocks, risks, and crisis. As a new domain, administrative resilience was used in governance system to address uncertainty and complexity (Vandenabeele 2007). Generally, two considerations of administrative systems are related to resilience: first, the level of concept, plan, and preparation of administrative system to prevent, mitigate, and adapt to the adversity and, second, the level of response to uncertainty and complexity through innovation, learning, and adaptation strategies. The ultimate goal of administrative resilience is to enable people, community, system, or organization to "bounce back" to a previous normal condition. Administrative resilience promotes the ability of social systems to remain stable during and after times of adversity.

## Characteristics of Administrative Resilience

The major characteristics of an administrative system are varied according to size, heterogeneity, flexibility, and dynamic nature. The size of an administrative system may be small or large. The small administrative system consists of few people or groups within an organization, whereas large system consists of a multitude of organizations. The participant should be individual or organization which have a diversity of assets, capabilities, aims, and barriers (Comfort et al. 2001). The administrative system should be flexible in a way that participant may come from jurisdiction level and various funding sources, and they can contact other administrative systems in seeking assistance to manage the adversity of disasters. The administrative system should be dynamic in nature so that participant can choose to interact, solve problems, and exchange ideas, goods, and services for optimum outcomes. Resilient administrative system should act as nested sets where the system is consisted with people and environment as parts of a system. So, the system as well as subsystems is important in the administrative system.

Every administrative system has three capacities such as absorptive, adaptive, and transformative capacity. In response to absorb the suddenly emerged hazards, risk, and challenges, administrators can adjust the structure and process of the organizational administrative system using adaptive capacity (Fig. 1). Similarly, an administrator can adapt any adverse conditions emerged due to hazards, risks, and threats by using an organizational adaptive system which is usually known as adaptive capacity.

According to Ostrom and Janssen (2005), there are seven principles of a resilient administrative system such as (i) specific boundaries, (ii) cost-benefit analysis, (iii) monitoring, (iv) matured sanctions, (v) problem-solving mechanism, (vi) right to organize and recognition, and (vii) nested enterprises. An administrative system must translate the policy into action like it has a technical infrastructure for information management because of its necessity to collect, process, and translate the information into action for disaster management. Transformative capacity is not only transforming policy, rules, regulations, and information but also taking immediate action for managing the hazardous condition in an effective way.

**Administrative Resilience: Potential Approach for Disaster Management, Fig. 1** The major elements of administrative resilience

Advancement of organizational learning can promote administrative resilience. The administrative system can modify the internal and external challenges by gaining knowledge and organizational learning and various capacities. But organizational learning is fully depended on the demand of the operational environment (Fiol and Lyles 1985), organizational structure (Morgan 2006), way of interpretation of information (Daft and Lengel 1986), and memory of organization using proper technology (Dodgson 1993). The effective decision for crisis management requires the availability of information which can enable the administrative capacity. The ineffective decision can reduce the administrative capacity of an individual organization as well as the whole administrative system.

In this case, technology can help to resolve the challenges of collection, processing, and dissemination of information as a collective action for enhancing the resilience of an administrative unit. Technology also can help administrators in two ways such as easy access and availability of technology for operational works and integration of technology for quick and accurate decision-making. Both ways are necessary for administrators who are engaged to deal with the uncertainty, risk, and natural hazards. The available technology for disaster management is like sensor technology for detection of weather condition, flood, cyclones, and storms, server and database for resource and personnel management, and communication technology such as cellular phone, the Internet, email, and community radio for better communication with official and people. Technological integration is not only necessary for decision-making but minimizing the gap between the operational environment and administrators. Though technology cannot do anything in itself, it requires better customization for translation of information into knowledge and action for disaster management.

## Administrative Resilience in Resilient Thinking Paradigm

Resilient thinking paradigm is an advanced thinking phase of public administration for dealing with the socio-ecological system under subfields like environmental governance, crisis management, organization studies, and natural resource management (Duit 2016). This concept also gained acceptance of research on international politics and governance of risks, threats, and uncertainties. It was social learning and adaptation strategies for tackling the adverse effects of natural disasters. Resilient thinking provides an opportunity for public administrators to make public goods and services for a citizen in a dynamic and changing complex environment. It is particularly beneficial for resilient governance arrangements like stakeholders' participation, knowledge and information management, and resilient institutional structure. Administrative resilience is a suitable approach under the resilient thinking paradigm of public administration for disaster management.

## Conclusion

As a key tool, administrative resilience promotes an administrative system to protect, save, and reduce vulnerability in the face of natural hazards. Administrative resilience always considers public values, social norms and values, the technical capacity of public administration, environmental issues, and administrative reforms in the context of shocks, risks, and other vulnerabilities. The status of administrative resilience in a social system is considered as poor when it is unable to develop the system due to administrative unwillingness, ignores disaster-prone hot areas, exercises corruption in project implementation, and avoids local people and adaptation strategies. Various capacities of the administrative system will be enhanced by following the disaster management policies, related laws, and regulations, involving local people's participation in decision-making, and utilizing resources, expertise, and context-specific information. Administrative resilience can be enhanced through developing a disaster information-based database to support quick decision-making; strengthening policies, accountability, and transparency of the administrative unit; enabling warning system and

physical structure of the community; and promoting international collaboration to gain experiences from success events and disaster management funding.

# Administrative Responsibility

Sid Olufs
Department of Politics & Government, Pacific Lutheran University, Tacoma, WA, USA

## Synonyms

Accountability; Legislative oversight of bureaucracy

## Definition

Administrative responsibility is the control of officials in administrative organizations by officials with legitimate political authority.

## Introduction

During the twentieth century, the wealthiest countries of the world experienced growth, and war,

beyond previous experience. The growth of the administrative state in the developed democracies was a part of this economic and military expansion and gave rise to theoretical development of the concept of administrative responsibility. We should note the discipline's discussion of *administrative responsibility* overlaps substantially with that of *accountability*, the former coming out of a focus on the wealthy representative democracies. There is no disciplinary consensus on the boundaries of either concept.

## The Classical Definition

Max Weber offered an account of bureaucracy that, in many ways, the field is still trying to catch up to (Weber 1978, Chap. XI.). Weber understood bureaucracy to be a modern development that was a product of the evolution of authority in societies. Bureaucracy became widespread because it was technically superior to other forms of organization in the things that mattered – gathering the resources within a country, keeping production going, and in military affairs.

But that technical superiority also held a source of social power that presented a tension for democratic politics. An unelected state apparatus that held power to tax, imprison, regulate, and otherwise control people presents a challenge to legitimate political authorities. The apparatus itself was a source of power beyond others that conferred political legitimacy. Further, Weber warned that once established bureaucracies are the most difficult social structures to destroy. Their quest to rationalize human activities has no inherent limit. They can turn on a society and reorder it according to the values that are embedded in the bureaucracies (Waldo 1948). Weber saw a fundamental and inescapable tension between modern administration and the politics of any particular society. Weber's warning was accompanied by a general claim that properly motivated politicians and administrators could exercise the powers appropriate to their respective, and largely separate, domains. This is hardly a satisfactory answer to the tension. Politicians are typically not experts on most policy questions, administrators are human beings whose motivations run far beyond the efficient commission of political guidance, and the laws passed by politicians are almost never precise guidelines for the behavior of administrators. The growth of the administrative state thus posed fundamental questions about democratic politics. In a representative democracy, bureaucratic discretion is a challenge to constitutional control of state power. Unelected administrators need to be either controlled by elected officials or subject to some other set of controls that support representative democracy.

Two decades before Weber, Woodrow Wilson suggested an additional layer to the tensions presented by bureaucracy (Wilson 1887). This suggests the problem of bureaucratic power came to the attention of scholars at least as early as the 1880s and illuminates an American cast to the problem. Wilson asserted a stark division between politics and administration, but he attempted to dampen conflicts through politically neutrality of bureaucratic officials. The neutrality of bureaucracy would be achieved through a separation of the public and administration. Put differently, he insisted we take the public out of public administration. And yet, the path to achieving that was curious. Civil servants could be neutral servants if they were products of a social consensus that incorporated elections and popular thought. He relied on the right people, properly educated men with the right values, to control bureaucracy. A quarter century later, Wilson was elected President with only 42% of the popular vote, in the Jim Crow era, before women were permitted to vote in national elections. The source, content, and durability of his social consensus were not things he examined closely. But, of course, they turn out to be important.

This tension over control of bureaucracy set the stage for the classic debate in public administration that still usefully frames an investigation of administrative accountability. In 1935 Carl J. Friedrich lectured on constitutional control at the London School of Economics, and given his background as a scholar of constitutional development and responsible bureaucracy, he offered a nuanced account of policymakers and administrators working and learning together, often making

mistakes and seeking improvement based on experience. In the audience was Herman Finer, a member of the faculty, who vehemently disagreed with Friedrich. Their arguments developed and were published in separate journals in 1940 (Finer 1941; Friedrich 1940).

Finer made the point simply: External control of bureaucracy is essential in a democracy. Elections confer legitimate authority onto office holders, who in turn pass laws. The roles of administrators start, and stop, where the law dictates.

Friedrich reiterated his position that things are not so simple and offered that the professional values of administrators are an essential part of the relationships that make bureaucracies responsible.

## Complications

The discipline of public administration has largely conceived of the Friedrich-Finer exchange as marking the two poles of a continuum, at one end a formal model of strict political accountability (Finer 1941) and at the other a recognition of the context of administration (Friedrich 1940).

If we see the two as marking the poles of one dimension, we should add some intersecting dimensions that produce a two- and then a three-dimensional space of possible features of administrative responsibility. One additional dimension is represented by the history of institutional reforms aimed at bureaucracy. At one end are those reforms intended to support democratic values in administration, such as the Administrative Procedures Act at the national and state levels. At the other end are reforms intended to improve bureaucratic performance, which include many attempts at budget controls that incorporate performance measures. There are mixes of the two, such as the establishment of Offices of Inspectors General, a reform that responded to the mostly political excesses of the Nixon presidency. That these and similar developments are typically labeled *reforms* should tell us something. Since Weber we have seen a constant search for the tensions posed by bureaucratic power in representative democracies.

A second additional dimension can represent the degree to which a political system incorporates the diverse values and preferences of a society. The more oligarchical or corrupt a representative democracy, for example, the less would a hierarchical approach to administrative responsibility lead to agreement and trust in policy outcomes. There is an inherent irony in Friedrich's position. The more democratic a society, the less the tension over democratic control of bureaucracy. Of course, implicit in Weber's analysis is the notion that it is bureaucracy itself that imperils democratic authority.
